PREFACE

This student exercise book is intended only to be used as an interactive teaching tool and a companion workbook for NHI Course No. 13239 – Module 9 “Geotechnical Earthquake Engineering”, and is not intended to be used as an individual exercise book. The extents and depths of the problems presented in this exercise book are limited due to the time constraint of the 2.5-day course schedule.

Module 9 “Geotechnical Earthquake Engineering” is the ninth module in a series of twelve modules that constitute a comprehensive training course in geotechnical and foundation engineering. Sponsored by the National Highway Institute (NHI) of the Federal Highway Administration (FHWA), the training course is given at different locations in the U.S. The course is tailored to the needs of both geotechnical and structural engineers who are involved in the analysis, design, and construction of surface transportation facilities in seismic areas.

A reference manual (FHWA-HI-99-012) was developed to provide information on how to apply principles of geotechnical earthquake engineering to planning, design, and retrofit of highway facilities. Detailed design examples illustrating the principles and analyses of geotechnical earthquake engineering are included in Part II of the reference manual.

Finally, this student exercise book is developed to be used as a living document. Additional student exercises or case histories may be given separately during the training session.

STUDENT EXERCISE NO. 1

Derivation of Site-Specific Design Ground Motion Parameters and Response Spectra.

Objective:

Design Earthquake and Site-Specific Response Spectra for a Firm Ground Site ($V_s = 760$ m/s) and Soft Clay Site ($V_s = 120$ m/s) in Boston, Massachusetts for 2% in 50-Year Probability of Exceedance.

Source Materials:

Reference Manual Part I: Figures 3-4, 3-5, 4-17, and 4-18, Tables 4-3 and 4-5.

USGS Website Data: 2% in 50-Year Seismic Hazard Data, Deaggregated Hazard Data for Boston, Massachusetts (attached).

1. Establish Free-Field Firm Ground Peak Horizontal Ground Acceleration from USGS Hazard Map (Figure 3-5):

$$PGA_{FF} = \underline{\hspace{2cm}}$$

2. Establish T_O and T_S for Normalized Spectra (Figure 4-18) For **Firm Ground** ($V_s = 760$ m/s)

- A. Establish Z Factor From Figure 3-4:

$$Z = \underline{\hspace{2cm}}$$

- B. Establish Site Class From Table 4-3

$$\text{Site Class} = \underline{\hspace{2cm}}$$

- C. Establish C_v From Table 4-5:

$$C_v = \underline{\hspace{2cm}}$$

D. Establish T_s From Inset on Figure 4-18:

$$T_s = \frac{C_v}{2.5Z} = \underline{\hspace{2cm}}$$

E. Establish T_o From Inset on Figure 4-18:

$$T_o = 0.2 T_s = \underline{\hspace{2cm}}$$

3. Plot Spectra on Attached Graph Paper
4. Repeat Steps 2 and 3 for **Soft Clay Site**
5. Plot Spectral Accelerations from USGS Website on Attached Graph
6. Subjectively Assess Design Earthquake Magnitude and Distance from USGS Website Data

A. $M = \underline{\hspace{2cm}}$

B. $D = \underline{\hspace{2cm}}$

Project Overview Page

1996 HAZARD MAPS

SEISMIC HAZARD

MAP INFO

GENERAL

Welcome to the USGS Zip Code earthquake ground motion hazard look-up page. Here you will be able to enter a 5 digit integer zip code and ground motion hazard values, expressed as a percent of the acceleration of gravity, (%g), will be returned to you. The ground motion hazard values returned will be Peak Ground Acceleration, (PGA), 0.2 second period spectral acceleration, (SA), 0.3 second period (SA), and 1.0 second period (SA) for 10%, 5%, and 2% probability of exceedence, (PE), in 50 years.

(These ground motion values are calculated for 'firm rock' sites which correspond to a shear-wave velocity of 760 m/sec. in the top 30m. Different soil sites may amplify or de-amplify these values.)

- The original zip code file was a freebee download from the Census Bureau, dated approximately January 1996, and thus may not reflect the most recent Zip Codes in use today.
- It has been determined that the latitude and longitude associated with each zip code is the average of the northern and southern most latitudes and the average of the eastern and western most longitudes of the zip code area. This location is not necessarily the Post Office location nor the centroid of the zip code area.
- In this look-up program each zip code location is associated with the nearest point on a grid of points 1/10 of a degree apart on which earthquake ground motions have been calculated covering the 48 adjacent states.

To find the ground motion values enter a 5 digit zip code in each of the blank boxes in the following table. Use the TAB key to move to the next table element. You may request from 1 to 12 Zip Codes.

About the Maps

1996 HAZARD MAPS**SEISMIC HAZARD****MAP INFO****GENERAL**

At 56 cities in the Central and Eastern U.S. (CEUS) and 44 cities in the Western U.S. (WUS), the seismic hazard corresponding to a two per cent probability of exceedance in 50 years is deaggregated by magnitude (M_w , or moment magnitude) and by epicentral distance (CEUS) or hypocentral distance (WUS). Hazard with respect to magnitude is binned into intervals of width 0.5 M_w . Hazard with respect to epicentral distance is binned into intervals of 25 km width. The hazard probabilities are deaggregated for the following ground motion parameters: PGA, 1.0, 0.3 and 0.2 second PSA.

Four matrices of per cent contribution to hazard are available at this web site. The matrices are organized with magnitude intervals corresponding to columns and distance intervals corresponding to rows. The first row of numbers gives the upper endpoint of the magnitude interval. For example, the number 6 means that seismic sources with magnitudes in the interval $5.5 < M_w \leq 6$ are included in hazard calculations for that column. The first column of numbers gives the upper endpoint of the epicentral distance interval. For example, the number 150. means that source-to-station distances in the interval $125 < d \leq 150$ km are included in the hazard calculations for that row. Missing rows, or gaps in the matrix, correspond to distance ranges for which the greatest per cent contribution to hazard is less than 0.0005, yielding a row of zeros to the level of precision given in the below data.

For the CEUS, the lowest magnitude considered for hazard calculations is $M_b L_g$ 5.0. This magnitude corresponds to $M_w = 4.7$ using the Johnston (1996) relationship between the two magnitudes. Thus, for CEUS cities, the interval width for the first column of contribution to hazard is about 0.3 M_w units, rather than 0.5 units, the usual interval width. For the WUS, the lowest magnitude considered for hazard calculations is $M_w = 5.0$.

An example graph of deaggregated seismic hazard for 1 Hz spectral acceleration for Washington, D.C., for 2% probability of exceedance in 50 years.

To obtain the four hazard matrices, go to the [CEUS map](#) or [WUS map](#) and click on the city (red dot). The entries are per cent contribution to hazard. They will sum to 100 per cent for each matrix.

SOLUTIONS TO EXERCISE NO. 1

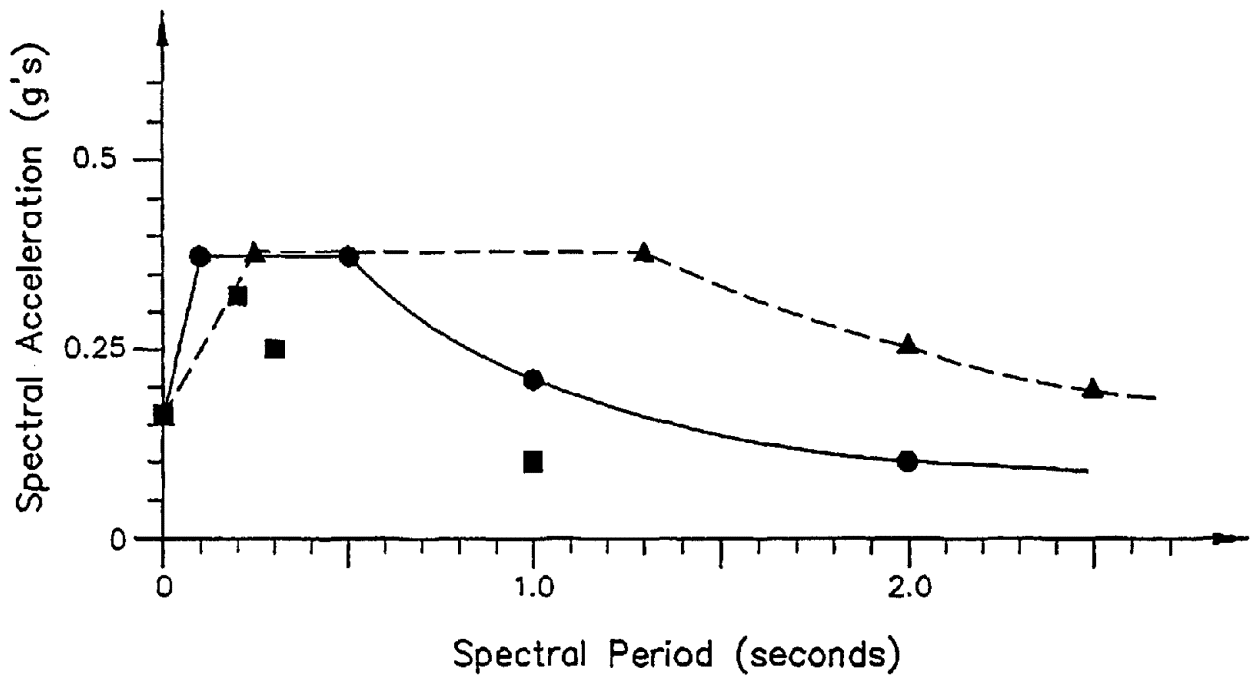

For Firm Ground Site:

1. $PGA_{FF} = 0.16 \text{ g}$
- 2A. $Z = 0.15$
- 2B. Site Class = S_B/S_C (On Boundary)
- 2C. $C_v = 0.20$ (Interpolate Between Site Classes S_B and S_C)
- 2D. $T_s = 0.53 \text{ s}$
- 2E. $T_o = 0.11 \text{ s}$

For Soft Ground Site:

- 4A. $Z = 0.15$
- 4B. Site Class = S_E
- 4C. $C_v = 0.50$
- 4D. $T_s = 1.33 \text{ s}$
- 4E. $T_o = 0.27 \text{ s}$

See Attached Plot of Spectra, USGS Data.

STUDENT EXERCISE NO. 2A

Computation of Standardized and Normalized SPT Blow Count Number, $(N_1)_{60}$

Objective:

Derive Normalized and Standardized SPT Blow Counts, $(N_1)_{60}$, at 6 m Below Ground Surface at a Site Shown in Figure S2A-1.

- Soil Properties and Uncorrected Field SPT-N Values Are Shown in Figure S2A-1.
- SPTs Were Performed Using a Donut Hammer with Rope and Pulley.
- Standard SPT Sampler (with Room for Liners) Was Used without Liners.
- Borehole Diameter: 100 mm

Source Materials:

Reference Manual Part I: Section 5.4.2 Equations 5-6, 5-7, 5-8, 5-10, and 5-11, and Tables 5-2 and 5-3.

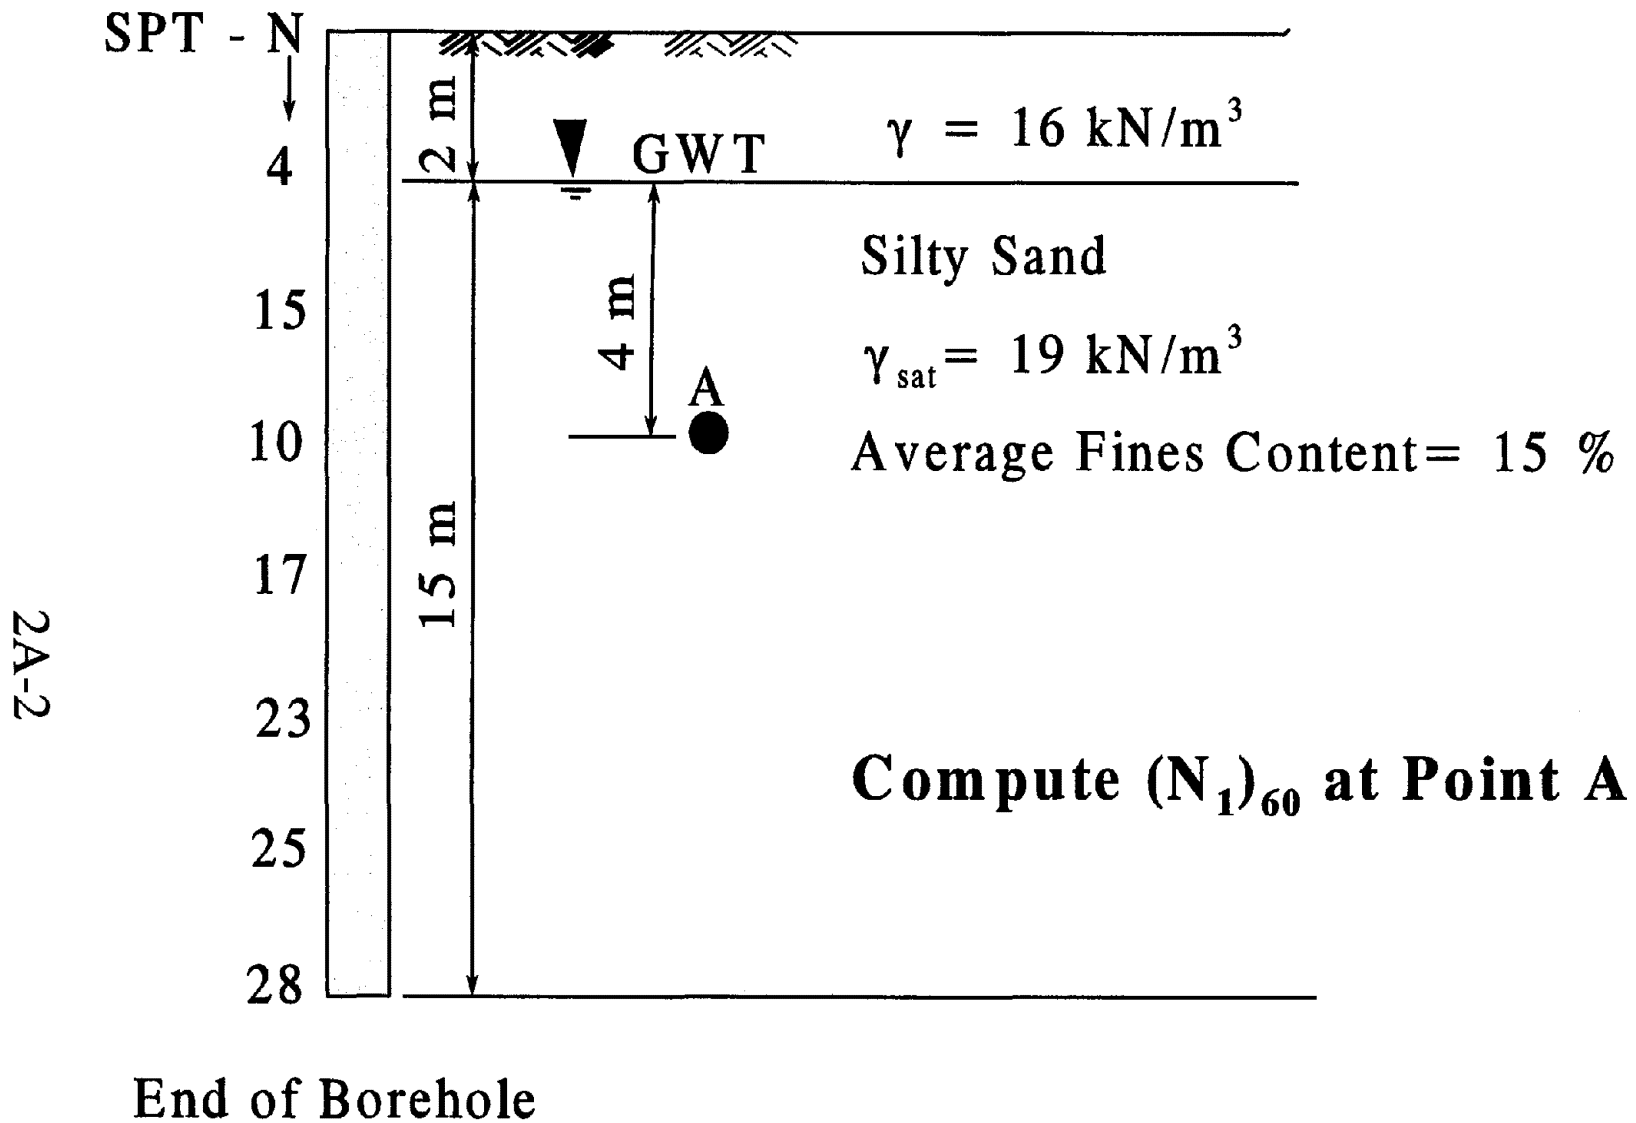

Figure S2A-1: Soil Profile and Field SPT-N Values

Compute $(N_1)_{60}$

1. Use Equations 5-6 and 5-11

$$(N_1)_{60} = C_N \cdot N_{60} = C_N C_{60} N$$

2. Standardization

Use Equations 5-7 and 5-8 and Tables 5-2 and 5-3.

$$C_{60} = C_{HT} C_{HW} C_{SS} C_{RL} C_{BD}$$

$$C_{60} = \underline{\hspace{4cm}}$$

3. Normalization

Compute Effective Overburden Pressure, σ'_v

$$\sigma'_v = \underline{\hspace{4cm}}$$

Compute Overburden Correction Factor Using Equation 5-10

$$C_N = 9.79 \left(\frac{1}{\sigma'_v} \right)^{1/2}$$

$$C_N = \underline{\hspace{2cm}}$$

4. Compute $(N_1)_{60} = C_N C_{60} N$

$$(N_1)_{60} = \underline{\hspace{2cm}}$$

TABLE 5-3
CORRECTION FACTORS FOR NON-STANDARD SPT PROCEDURE AND EQUIPMENT
(Richardson, *et al.*, 1995; Youd and Idriss, 1997)

Correction for	Correction Factor	Reference
Nonstandard Hammer Type (DH = doughnut hammer; ER = energy ratio)	$C_{HT} = 0.75$ for DH with rope and pulley $C_{HT} = 1.33$ for DH with trip/auto & ER = 80	Seed, <i>et al.</i> (1985)
Nonstandard Hammer Weight or Height of Fall (H = height of fall in mm; W = hammer weight in kg)	$C_{HW} = \frac{H \cdot W}{63.5 \cdot 762}$	calculated per Seed, <i>et al.</i> (1985)
Nonstandard Sampler Setup (standard samples with room for liners, but used without liners)	$C_{SS} = 1.10$ for loose sand $C_{SS} = 1.20$ for dense sand	Seed, <i>et al.</i> (1985)
Nonstandard Sampler Setup (standard samples with room for liners, and liners are used)	$C_{SS} = 0.90$ for loose sand $C_{SS} = 0.80$ for dense sand	Skempton (1986)
Short Rod Length	$C_{RL} = 0.75$ for rod length 0-4 m $C_{RL} = 0.85$ for rod length 4-6 m $C_{RL} = 0.95$ for rod length 6-10 m $C_{RL} = 1.0$ for rod length 10-30 m $C_{RL} < 1.0$ for rod length > 30 m	Seed, <i>et al.</i> (1983); Youd and Idriss (1997)
Nonstandard Borehole Diameter	$C_{BD} = 1.05$ for 150 mm borehole diameter $C_{BD} = 1.15$ for 200 mm borehole diameter	Skempton (1986)

Notes: N = Uncorrected SPT blow count.

$$C_{60} = C_{HT} \cdot C_{HW} \cdot C_{SS} \cdot C_{RL} \cdot C_{BD}$$

$$N_{60} = N \cdot C_{60}$$

C_N = Correction factor for overburden pressure.

$$(N_1)_{60} = C_N \cdot N_{60} = C_N \cdot C_{60} \cdot N$$

SOLUTIONS TO EXERCISE NO. 2A

1. $(N_1)_{60} = C_N C_{60} N$

2. Standardization

$$C_{60} = C_{HT} C_{HW} C_{SS}^{(1)} C_{RL}^{(2)} C_{BD} \text{ (Equations 5-7 and 5-8)}$$

$$C_{60} = 0.75 \times 1 \times 1.1 \times 0.95 \times 1$$

$$C_{60} = \underline{\quad 0.78 \quad}$$

- Note:
- (1) For loose sand ($N=10$), use $C_{SS}=1.10$ (Table 5-3)
 - (2) For rod length greater than 6 m, use $C_{RL}=0.95$ (Table 5-3)

3. Normalization

Compute Effective Overburden Pressure, σ'_v

$$\sigma'_v = \gamma \times 2\text{m} + (\gamma_{\text{sat}} - \gamma_w) \times 4\text{m}$$

$$\sigma'_v = 16 \times 2\text{m} + (19 - 9.81) \times 4\text{m}$$

$$\sigma'_v = \underline{\quad 69 \text{ kPa} \quad}$$

Compute Overburden Correction Factor, C_N

$$C_N = 9.79 \left(\frac{1}{69} \right)^{1/2} \quad (\text{Equation 5-10})$$

$$C_N = \underline{1.18}$$

4. Compute $(N_1)_{60} = C_N C_{60} N$

$$(N_1)_{60} = 1.18 \times 0.78 \times 10$$

$$(N_1)_{60} \approx \underline{9}$$

STUDENT EXERCISE NO. 2B

Development of Soil Profile Using CPT Data.

Objective:

Develop Soil Stratigraphy Using Cone Penetration Data Shown in Figure S2B-1. Estimate the Equivalent SPT-N Values Using CPT-SPT Correlation Charts.

Source Materials:

Reference Manual Part I: Sections 5.4.2, Figures 5-6 and 5-7.

DEVELOP SOIL PROFILE USING CPT DATA

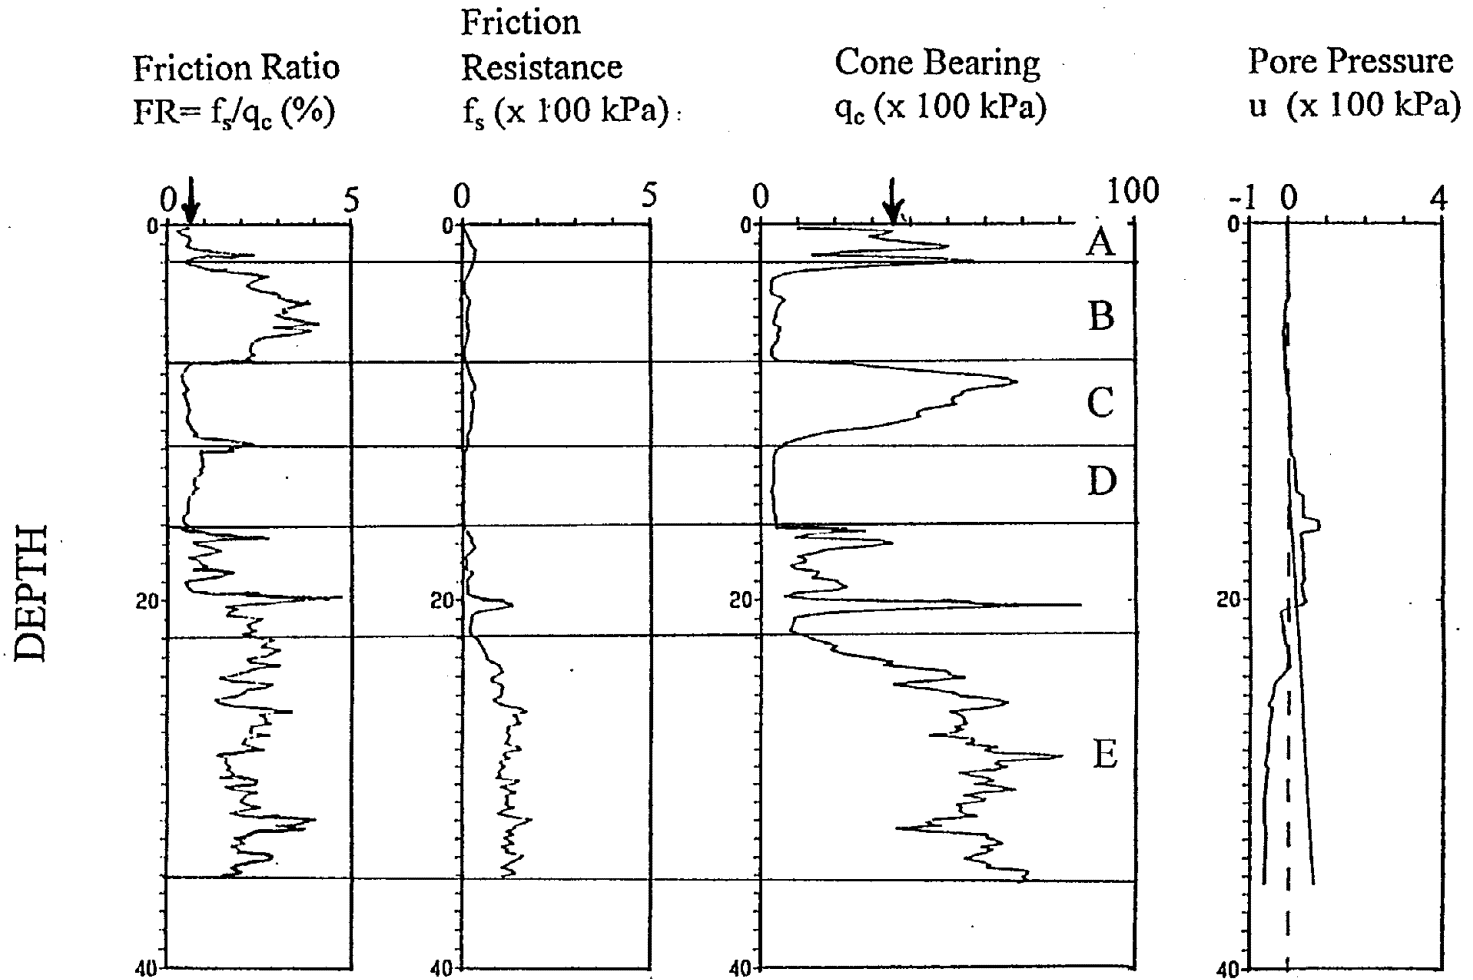

Figure S2B-1: CPT Data Profile

2B-2

2B-3

Stratum	Effective Vertical Stress (kPa)	Mean Grain Size (mm)	Cone Resistance q_c (x 100 kPa)	Normalized Cone Resistance q_{cl} (x 100 kPa)	Friction Ratio FR (%)	Soil Type	Equivalent SPT-N Value
A	6 kPa	0.2 mm	35	88	0.6	Sand to Silty Sand	7
B	25 kPa	0.003 mm					
C	40 kPa	0.2 mm					
D	50 kPa	0.003 mm					
E	85 kPa	0.2 mm					

Table S2B-1: Effective Vertical Stress and Mean Grain Size for Each Stratum

For Stratum A:

1. Determine the normalized cone resistance q_{c1} .

$$q_c = 3,500 \text{ kPa (from Figure S2B-1)}$$

$$\sigma'_v = 6 \text{ kPa (from Table S2B-1)}$$

(Using Figure 5-6)

$$\begin{aligned} q_{c1} &= q_c (3.5 - 1.25 \log_{10} \sigma'_v) \\ &= 88 \text{ (x 100 kPa)} \end{aligned}$$

2. Determine the soil behavior type.

$$q_{c1} = 88 \text{ (x 100 kPa)}$$

Friction Ratio = 0.6% (from Figure S2B-1)

⇒ Stratum A is **Sand to Silty Sand** (using Figure 5-6)

3. Determine the equivalent SPT-N value.

Mean Grain Size $D_{50} = 0.2$ mm (from Table S2B-1)

$q_c / N = 4.7$ (using Figure 5-7)

$$\Rightarrow N = q_c / 4.7 = 35 / 4.7 \approx 7$$

(Note: q_c in bars. 1 bar = 100 kPa)

Determine Soil Behavior Types and the Equivalent SPT-N Values for Strata B, C, D, and E.

$$q_{c1} = q_c (3.5 - 1.25 \log_{10} \sigma_v')$$

with σ_v' , q_c , q_{c1} in kPa.

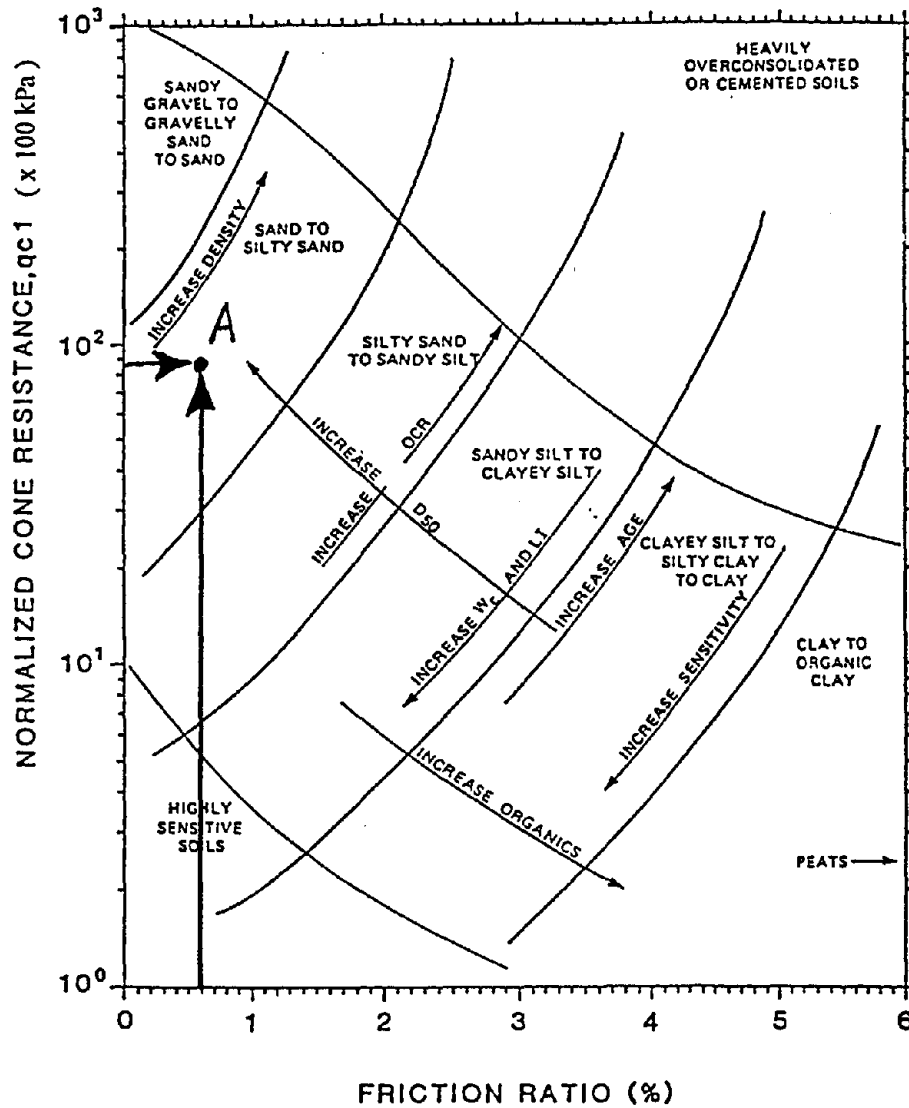

Figure 5-6: Soil Behavior Type Classification Chart Based on the CPT. (Douglas, 1984, 1981, reprinted from FHWA-SA-91-043, 1992.)

BASED ON ENERGY RATIO OF 60% (N_{60})

q_c in bars (1 bar = 100 kPa)

Figure 5-7: CPT-SPT Correlation Chart. (Robertson et al., 1983, reprinted from FHWA-SA-91-043, 1992.)

SOLUTIONS TO EXERCISE 2B

Stratum	Effective Vertical Stress (kPa)	Mean Grain Size (mm)	Cone Resistance q_c (x 100 kPa)	Normalized Cone Resistance q_{c1} (x 100 kPa)	Friction Ratio FR (%)	Soil Type	Equivalent SPT-N Value
A	6 kPa	0.2 mm	35	88	0.6	Sand to Silty Sand	7
B	25 kPa	0.003 mm	4	7	3.5	Silty Clay	3
C	40 kPa	0.2 mm	45	67	0.8	Sand to Silty Sand	9
D	50 kPa	0.003 mm	3.5	5	1	Sensitive Silt	2
E	85 kPa	0.2 mm	55	60	2	Silty Sand to Sandy Silt	12

2B-8

$$q_{C1} = q_C (3.5 - 1.25 \log_{10} \sigma_v')$$

with σ_v' , q_C , q_{C1} in kPa.

Figure 5-6: Soil Behavior Type Classification Chart Based on the CPT. (Douglas, 1984, 1981, reprinted from FHWA-SA-91-043, 1992.)

BASED ON ENERGY RATIO OF 60% (N_{60})

q_c in bars (1 bar = 100 kPa)

Figure 5-7: CPT-SPT Correlation Chart. (Robertson et al., 1983, reprinted from FHWA-SA-91-043, 1992.)

STUDENT EXERCISE NO. 3

G_{\max} Derivation by Empirical Correlations.

Objective:

Evaluate Dynamic Material Properties for Sand at 25 meters with a Void Ratio of 0.5 and the Water Table at 10 m Using Empirical Correlations. Assume a Moist Unit Weight of 18 kN/m^3 and a Saturated Unit Weight of 20.5 kN/m^3 . Assume a Friction Angle $\phi = 30^\circ$ for the Sand.

Source Materials:

Reference Manual Part I: Table 5-5, Figures 5-12, 5-13, 5-14, Equations 5-11, 5-12, 5-13, and 5-14.

1. Calculate Mean Effective Stress Using Equation 5-12:

$$\sigma_v' = \underline{\hspace{2cm}}$$

$$K_o = \underline{\hspace{2cm}}$$

$$\sigma_m' = \underline{\hspace{2cm}}$$

2. Assign $(K_2)_{\max}$ from Figure 5-12:

$$(K_2)_{\max} = \underline{\hspace{2cm}}$$

3. Calculate G_{\max} from Equation 5-14:

$$G_{\max} = \underline{\hspace{2cm}}$$

4. Assign modulus reduction and damping curves from Figures 5-12, 5-13, and 5-14:

Figure 5-12: Shear Modulus Reduction Curves for Sands. (Seed and Idriss, 1970, reprinted by permission of ASCE)

TABLE 5-5
CORRELATIONS FOR ESTIMATING INITIAL SHEAR MODULUS

Reference	Correlation	Units	Limitation
Seed, <i>et al.</i> (1984)	$G_{\max} = 220 (K_2)_{\max} (\sigma'_m)^{1/2}$ $(K_2)_{\max} \approx 20(N_1)_{60}^{1/3}$	kPa	$(K_2)_{\max} \approx 30$ for very loose sands and 75 for very dense sands; $\approx 80-180$ for dense well graded gravels; Limited to cohesionless soils
Imai and Tonouchi (1982)	$G_{\max} = 15,560 N_{60}^{0.68}$	kPa	Limited to cohesionless soils
Hardin (1978)	$G_{\max} = \frac{625}{(0.3 + 0.7 e_o^2)} (P_a \cdot \sigma'_m)^{0.5} \text{OCR}^k$	kPa ^{(1) (3)}	Limited to cohesive soils $P_a =$ atmospheric pressure
Jamiolkowski, <i>et al.</i> (1991)	$G_{\max} = \frac{625}{e_o^{1.3}} (P_a \cdot \sigma'_m)^{0.5} \text{OCR}^k$	kPa ^{(1) (3)}	Limited to cohesive soils $P_a =$ atmospheric pressure
Mayne and Rix (1993)	$G_{\max} = 99.5(P_a)^{0.305}(q_c)^{0.695}/(e_o)^{1.13}$	kPa ⁽²⁾	Limited to cohesive soils $P_a =$ atmospheric pressure

- Notes: (1) P_a and σ'_m in kPa
(2) P_a and q_c in kPa
(3) The parameter k is related to the plasticity index, PI, as follows:

PI	k
0	0
20	0.18
40	0.30
60	0.41
80	0.48
> 100	0.50

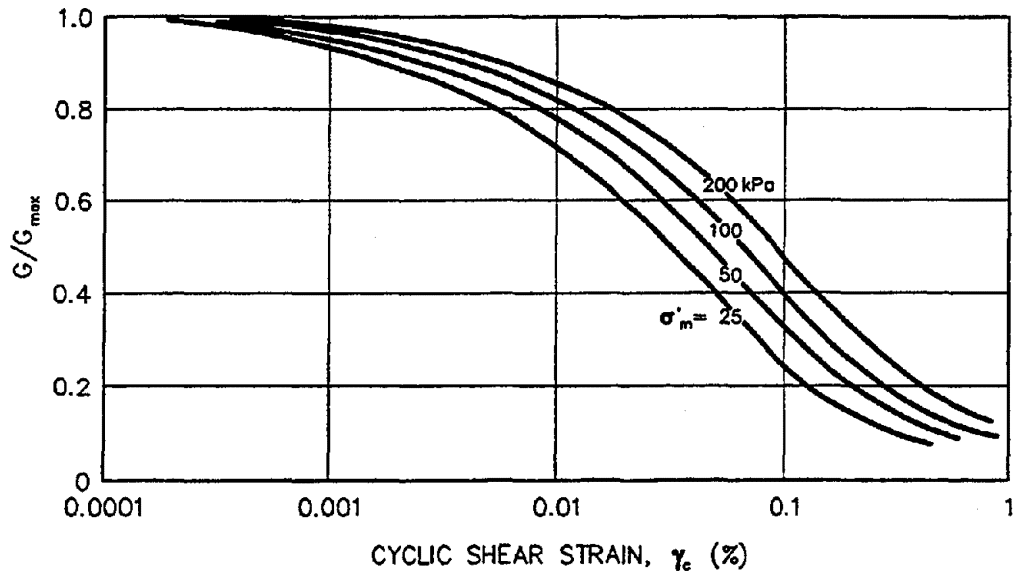

Figure 5-13: Shear Modulus Reduction Curves for Sands. (Iwasaki, *et al.*, 1978, reprinted by permission of Japanese Society of Soil Mechanics and Foundation Engineering)

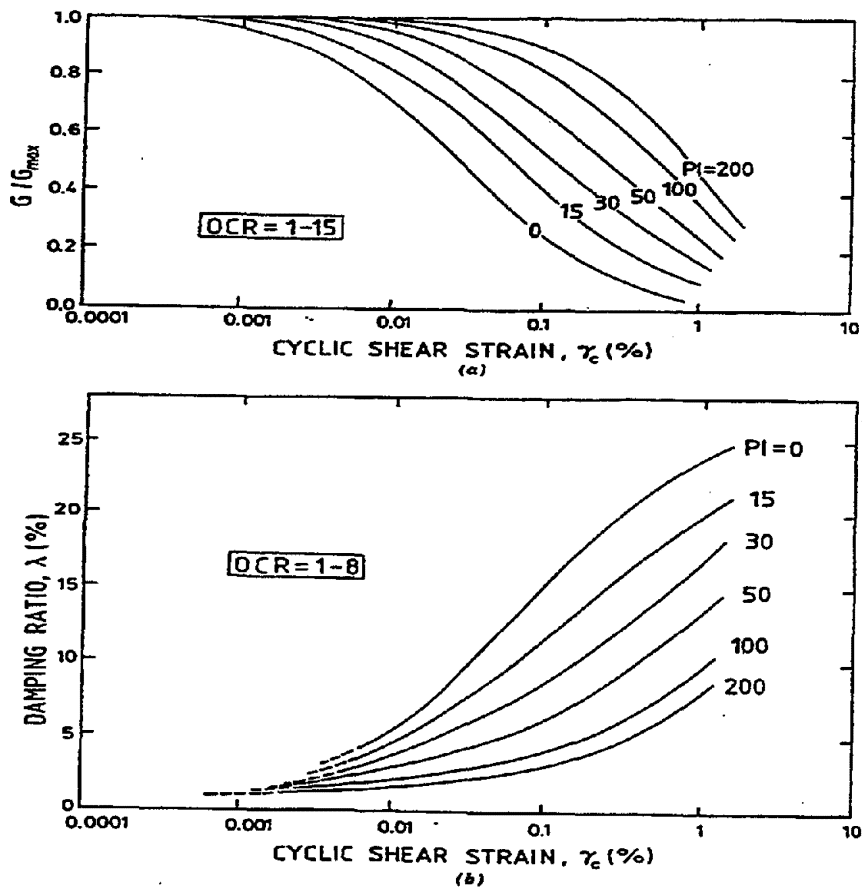

Figure 5-14: Shear Modulus Reduction and Damping Ratio as a Function of Shear Strain and Soil Plasticity Index. (Vucetic and Dobry, 1991, reprinted by permission of ASCE)

SOLUTIONS TO EXERCISE NO. 3

1. $\sigma_v' = (10 \times 18) + (15 \times 10.7) = 340.5 \text{ kPa}$

$$K_o = 0.5 \quad (\text{See note 1})$$

Use Equation 5-12

$$\sigma_m' = \left[\frac{1+2k_v}{3} \right] \times \sigma_v' = 227 \text{ kPa}$$

2. From Figure 5-12, for $e = 0.5$ (see note 2),

$$(K_2)_{\max} = 60$$

3. Use Equation 5-14

$$\begin{aligned} G_{\max} &= 220(K_2)_{\max}(\sigma_m')^{1/2} = 20(60)(227)^{0.5} = 198,878 \text{ kPa} \\ &= 200 \text{ MPa} \end{aligned}$$

4. Use either $e = 0.5$ curve from Figure 5-12,

$\sigma_m' = 200 \text{ kPa}$ curve from Figure 5-13, or $PI = 0$ curve from Figure 5-14 for modulus reduction.

Use $PI = 0$ curve from Figure 5-14 for damping

Notes: 1) K_o can be derived as $(1 - \sin\phi)$

2) Void ratio can be derived from unit weight using $\gamma = \frac{G_s \gamma_w}{1+e}$,

where $G_s = \text{Specific Gravity}$

STUDENT EXERCISE NO. 4

Simplified Site Response Analysis.

Objective:

For Site Profile in Figure S4-1, with a Free-Field Peak Horizontal Ground Acceleration on Firm Ground Equal to 0.16 g, Evaluate:

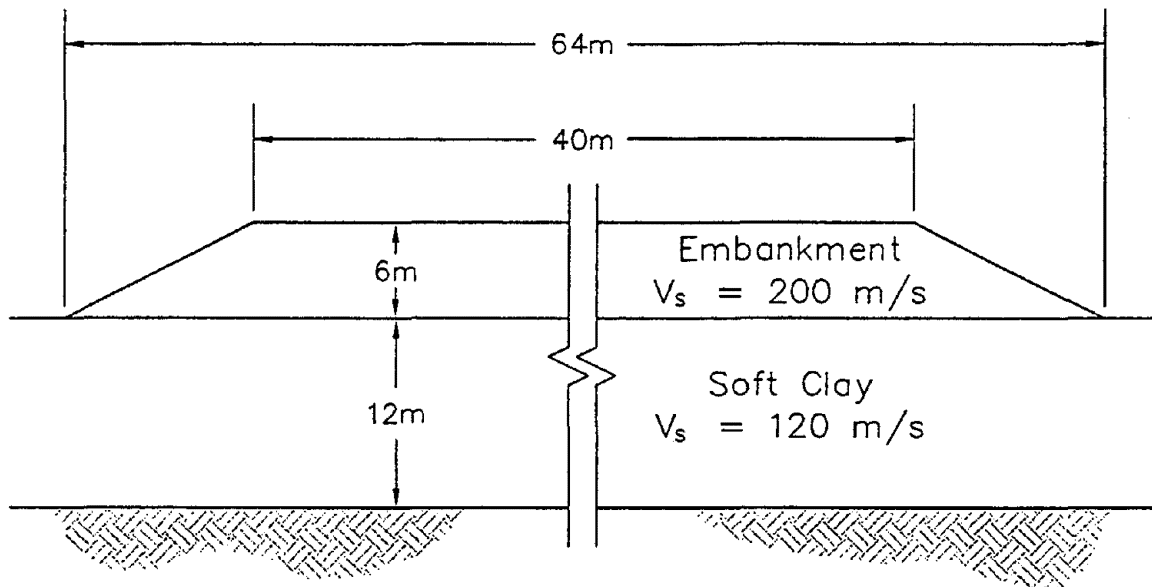

- Free Field Peak Ground Acceleration;
- Peak Acceleration at Top of Embankment;
- Fundamental Period of Clay Deposit in Free Field;
- Fundamental Period of Embankment.

Source Materials:

Reference Manual Part I: Figures 4-19, 6-3, 6-4, and Equation 4-5.

1. Establish Free-Field Peak Ground Acceleration at Top of Clay From Figure 6-3:

$$PGA_{FF} = \underline{\hspace{2cm}}$$

EXAMPLE

Figure S4-1: Soil Profile

2. Evaluate Peak Acceleration at Top of Embankment from Figure 6-4:

$$PGA_{EMB} = \underline{\hspace{2cm}}$$

3. Evaluate Fundamental Period of Clay Layer, T_o ($= 1/f_o$), from Equation 4-5:

$$(T_o)_{FF} = \frac{4H}{V_s}$$

$$(T_o)_{FF} = \underline{\hspace{2cm}}$$

4. Evaluate Fundamental Period of Embankment from Figure 4-19:

A. $H =$ _____

B. $h =$ _____

C. $\lambda = \frac{h}{H} =$ _____

D. $a_n =$ _____

E. $(T_o)_{EMB} = \frac{a_n H}{V_s} =$ _____

Figure 6-3: Relationship Between PHGA on Rock and on Soft Soil Sites. (Idriss, 1990)

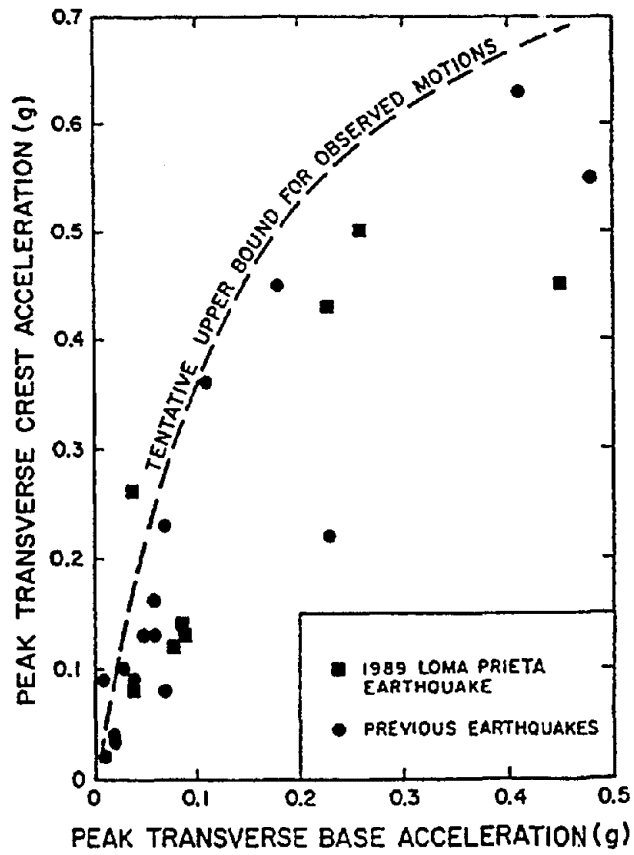

Figure 6-4: Comparisons of Peak Base and Crest Accelerations Recorded at Earth Dams. (Harder, 1991)

λ	a_n
0.00	2.405
0.03	2.409
0.05	2.416
0.10	2.448
0.15	2.501
0.20	2.574
0.25	2.668
0.30	2.786
0.35	2.930
0.40	3.107
0.45	3.323
0.50	3.588
1.00	4.0

Note: For $0.5 \leq \lambda \leq 1.0$, a_n may be derived by linear interpolation from $a_n = 3.6$ for $\lambda = 0.5$ to $a_n = 4.0$ for $\lambda = 1.0$.

Figure 4-19: Fundamental Frequency of Trapezoidal Dam/Embankment

SOLUTIONS TO EXERCISE NO. 4

1. $PGA_{FF} = 0.26 \text{ g}$ (see attached figure)
2. $PGA_{EMB} = 0.56 \text{ g}$ (see attached figure)
3. $(T_o)_{FF} = \frac{4H}{V_s} = \frac{4 \times 12}{120} = 0.4 \text{ s}$
- 4A. $H = 16 \text{ m}$
- 4B. $h = 10 \text{ m}$
- 4C. $\frac{h}{H} = \frac{10}{16} = 0.625$
- 4D. $a_n = \frac{0.625 - 0.5}{1 - 0.5}(4 - 3.588) + 3.588 = 3.69$
- 4E. $(T_o)_{EMB} = \frac{3.69 \times 6}{200} = 0.11 \text{ s}$

Figure 6-3: Relationship Between PHGA on Rock and on Soft Soil Sites. (Idriss, 1990)

Figure 6-4: Comparisons of Peak Base and Crest Accelerations Recorded at Earth Dams. (Harder, 1991)

STUDENT EXERCISE NO. 5

Preparation of SHAKE Input.

Objective:

Develop Input Data for SHAKE Analysis of Soil Profile Shown in Figure S5-1 Using Soil Data Provided in Table S5-1.

Source Materials:

Reference Manual Part I: Figures 4-19, 5-12, 5-13, 5-14, Table 5-5, and Equations 5-2, 5-3, and 5-12.

Reference Manual Part II: Figures 4-3a through 4-10.

1. Evaluate Properties at Center of Silt
 - A. Evaluate Mean Normal Effective Stress Using Equation 5-12

$$\sigma_v' = \underline{\hspace{4cm}}$$

$$\sigma_m' = \underline{\hspace{4cm}}$$

EXAMPLE

Figure S5-1: Subsurface Profile

TABLE S5-1
SUMMARY OF AVAILABLE INFORMATION

	Unit Weight (kN/m³)	PI (%)	OCR	(N₁)₆₀	D_r (%)	e_o
Embankment Fill	19.5	0	—	—	75	—
Organic Silt	12.0	50	1	—	—	3
Clay	16.0	15	1	—	—	1 - 1.2
Glacial Till	20.5	5	> 10	75	—	—
Weathered Rock	21.2	—	—	—	—	—

B. Evaluate Small Strain Shear Modulus Using Table 5-5 (Jamiolkowski, 1991):

$$G_{\max} = \underline{\hspace{2cm}}$$

C. Evaluate Shear Wave Velocity Using Equations 5-2 and 5-3:

$$V_s = \underline{\hspace{2cm}}$$

2. Evaluate Properties of Clay Layer:

A. Evaluate Effective Stresses at Top and Bottom of Clay

$$(\sigma_v')_{\text{TOP}} =$$

$$(\sigma_v')_{\text{BOTTOM}} =$$

$$(\sigma_m')_{\text{TOP}} =$$

$$(\sigma_m')_{\text{BOTTOM}} =$$

B. Evaluate G_{\max} at Top and Bottom of Clay

$$\begin{array}{cc} (G_{\max})_{\text{TOP}} = & (G_{\max})_{\text{BOTTOM}} = \\ \underline{\hspace{2cm}} & \underline{\hspace{2cm}} \end{array}$$

C. Evaluate Shear Wave Velocity at Top and Bottom of Clay

$$\begin{array}{cc} (V_s)_{\text{TOP}} = & (V_s)_{\text{BOTTOM}} = \\ \underline{\hspace{2cm}} & \underline{\hspace{2cm}} \end{array}$$

3. Evaluate Properties in Embankment 1 m from Top (Top) and 1 m Above Clay (Bottom)

A. Evaluate Effective Stresses

$$\begin{array}{cc} (\sigma_v')_{\text{TOP}} = & (\sigma_v')_{\text{BOTTOM}} = \\ \underline{\hspace{2cm}} & \underline{\hspace{2cm}} \end{array}$$

$$\begin{array}{cc} (\sigma_m')_{\text{TOP}} = & (\sigma_m')_{\text{BOTTOM}} = \\ \underline{\hspace{2cm}} & \underline{\hspace{2cm}} \end{array}$$

- B. Evaluate Small Strain Modulus Using Table 5-5 (Seed, et. al, 1984) and Figure 5-12

$$(G_{\max})_{\text{TOP}} = \underline{\hspace{2cm}} \qquad (G_{\max})_{\text{BOTTOM}} = \underline{\hspace{2cm}}$$

- C. Evaluate Shear Wave Velocity

$$(V_s)_{\text{TOP}} = \underline{\hspace{2cm}} \qquad (V_s)_{\text{BOTTOM}} = \underline{\hspace{2cm}}$$

4. Evaluate Properties in Center of Till

- A. Evaluate Effective Stresses

$$\sigma_v' = \underline{\hspace{2cm}}$$

$$\sigma_m' = \underline{\hspace{2cm}}$$

- B. Evaluate Small Strain Modulus Using Table 5-5 (Imai and Tonouchi, 1982)

$$G_{\max} = \underline{\hspace{2cm}}$$

C. Evaluate Shear Wave Velocity

$$V_s = \underline{\hspace{2cm}}$$

5. Assign Modulus Reduction and Damping Curves from Figures 5-12, 5-13, and 5-14

Soil	Figure Number	Curve
Silt		
Clay		
Embankment		
Till		

6. Calculate Fundamental Period of Clay Layer
Beneath the Embankment From Figure 4-19

A. $(V_s)_{AVE} = \underline{\hspace{2cm}}$

B. $a_n = \underline{\hspace{2cm}}$

C. $T_o = \underline{\hspace{2cm}}$

Figure 5-12: Shear Modulus Reduction Curves for Sands. (Seed and Idriss, 1970, reprinted by permission of ASCE)

Figure 5-13: Shear Modulus Reduction Curves for Sands. (Iwasaki, *et al.*, 1978, reprinted by permission of Japanese Society of Soil Mechanics and Foundation Engineering)

Figure 5-14: Shear Modulus Reduction and Damping Ratio as a Function of Shear Strain and Soil Plasticity Index. (Vucetic and Dobry, 1991, reprinted by permission of ASCE)

$$\lambda = \frac{h}{H}$$

$$f_c = \frac{(V_s)_{avg}}{a_n H}$$

f_c = Fundamental Frequency
 $H-h$ = Height of the Dam/Embankment
 V_s = Shear Wave Velocity
 a_n = coefficient

λ	a_n
0.00	2.405
0.03	2.409
0.05	2.416
0.10	2.448
0.15	2.501
0.20	2.574
0.25	2.668
0.30	2.786
0.35	2.930
0.40	3.107
0.45	3.323
0.50	3.588
1.00	4.0

Note: For $0.5 \leq \lambda \leq 1.0$, a_n may be derived by linear interpolation from $a_n = 3.6$ for $\lambda = 0.5$ to $a_n = 4.0$ for $\lambda = 1.0$.

Figure 4-19: Fundamental Frequency of Trapezoidal Dam/Embankment

SOLUTIONS TO EXERCISE NO. 5

Material	Location	γ kN/m ³	σ'_v kPa	σ'_m kPa	G_{max} kPa	V_s m/s	Modulus Reduction and Damping
Embankment	1 m from top 1 m above clay	19.5	19.5	19.5	60,230	174	PI = 0
			87.7	64.3	109,390	234	
Silt	Middle	12	2.2	1.5	1,820	39	PI = 50
Clay	Top	16	4.4	2.9	8,440	72	PI = 15
	Bottom		78.8	52.5	45,300	167	
	Top w/ Embankment		97.4	64.9	50,350	175

STUDENT EXERCISE NO. 6

Evaluation of Liquefaction Potential

Objective:

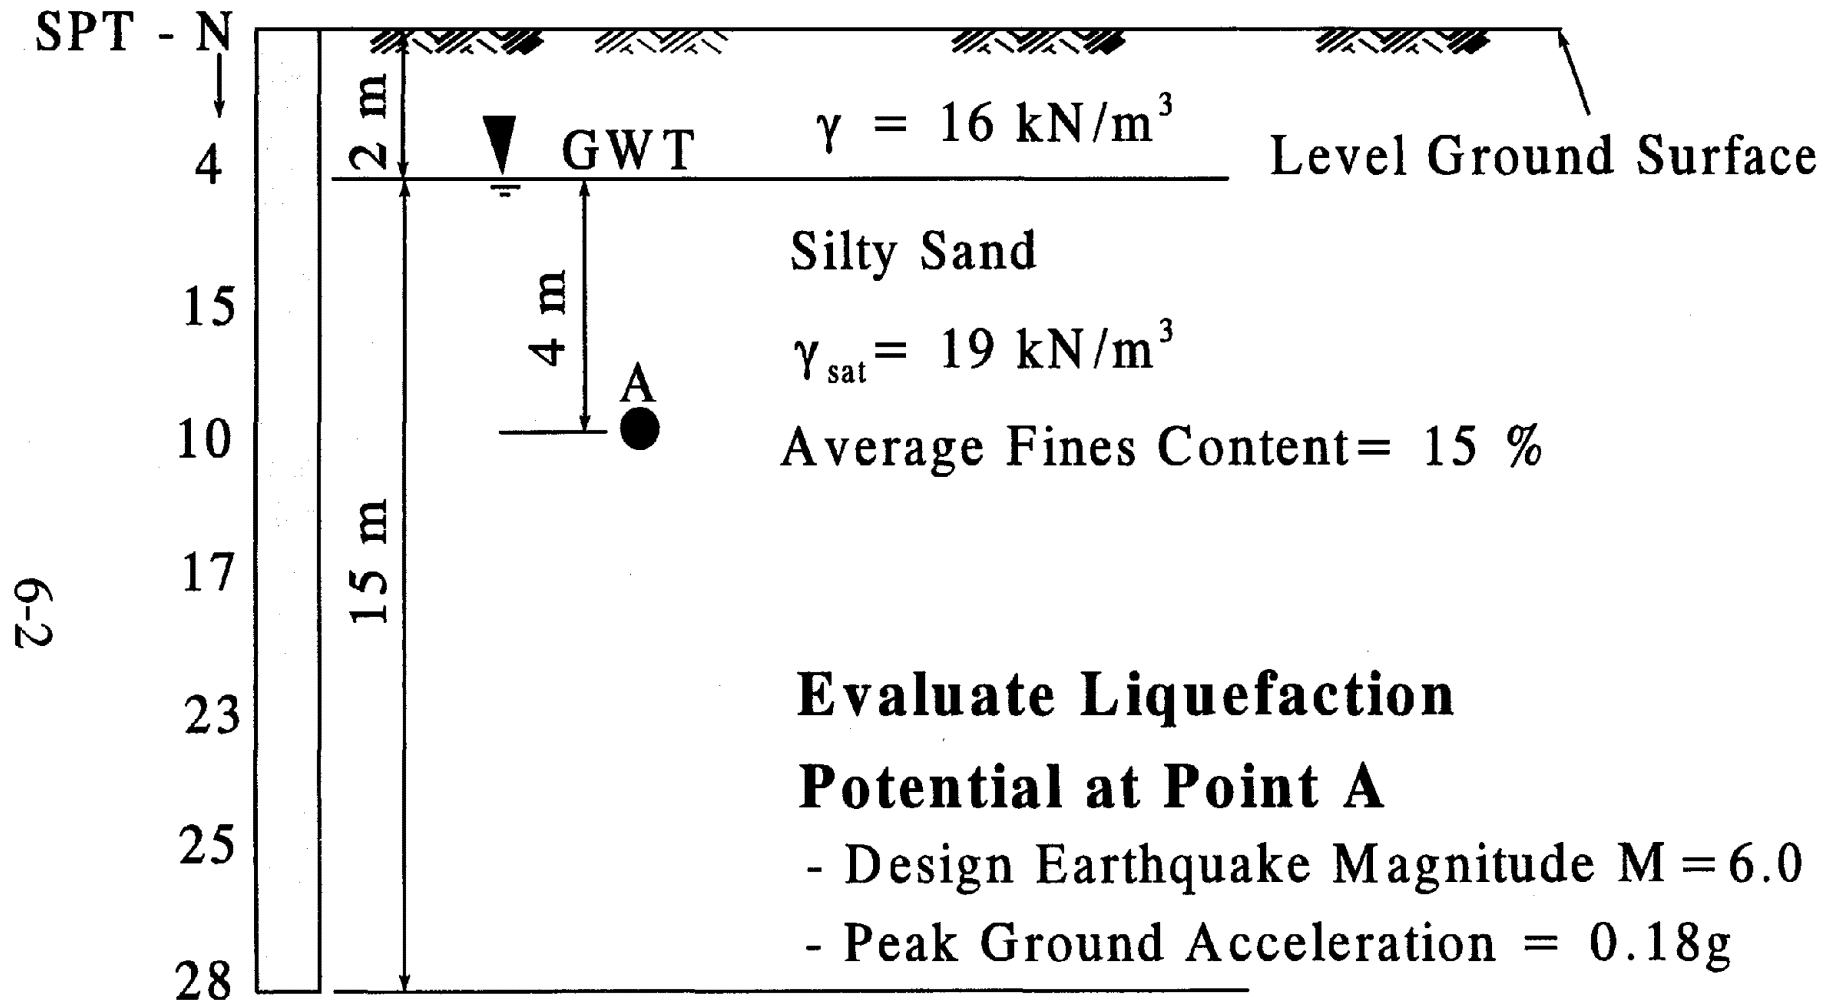

Evaluate the Liquefaction Potential at 6 m Below Ground Surface at a Site Shown in Figure S6-1.

- Soil Properties and SPT- N Values are Shown in Figure S6-1. (Same as in Exercise 2A)
- SPT- N Values and Sampling Procedure are the Same as in Exercise 2A.
- Design Earthquake Magnitude $M = 6.0$
- Peak Ground Acceleration = $0.18 g$

Source Materials:

Reference Manual Part I: Section 8.3.2, Figures 8-2, 8-3, 8-4, 8-5, and 8-6 and Equations 8-1, 8-3a, 8-4 and 8-5.

Student Exercise No. 2A

End of Borehole

Figure S6-1: Soil Profile

Step 1: Develop Subsurface Profile
(Boring with SPT-N Values Given)

Step 2: Compute Effective Overburden Pressure, σ'_v

$$\sigma'_v = 69 \text{ kPa} \quad (\text{From Student Exercise No. 2A})$$

Compute Total Overburden Pressure, σ_v

$$\sigma_v = \underline{\hspace{2cm}}$$

Evaluate Initial Shear Stress, τ_{ho}

$$\tau_{ho} = \underline{\hspace{2cm}}$$

Step 3: Evaluate Stress Reduction Factor, r_d (Equation 8-1 or Figure 8-2)

$$r_d = \underline{\hspace{2cm}}$$

Step 4: Calculate Cyclic Stress Ratio Induced by Earthquake, CSR_{EQ} (Equation 8-3a)

$$CSR_{EQ} = 0.65 \left(\frac{a_{\max}}{g} \right) r_d \left(\frac{\sigma_v}{\sigma'_v} \right)$$

$$CSR_{EQ} = \underline{\hspace{2cm}}$$

Step 5: Standardized SPT N Value

$$C_{60} = 0.78 \quad (\text{From Student Exercise No. 2A})$$

Step 6: Normalized SPT N Value

$$C_N = 1.18 \quad (\text{From Student Exercise No. 2A})$$

$$(N_1)_{60} = C_N C_{60} N$$

$$(N_1)_{60} = 1.18 \times 0.78 \times 10$$

$$(N_1)_{60} \approx 9 \quad (\text{From Student Exercise No. 2A})$$

Step 7: Determine Soil Resistance to Liquefaction in Terms of Cyclic Stress Ratio (Use Figure 8-3)

$$CSR_{M=7.5} = \underline{\hspace{2cm}}$$

Step 8: Correct CSR for Earthquake Magnitude, Initial Shear Stress and Effective Overburden Pressure

$$CSR_L = CSR_{M=7.5} k_M k_\alpha k_\sigma \quad (\text{Use Figures 8-4, 8-5 and 8-6})$$

$$CSR_L = \underline{\hspace{2cm}}$$

Step 9: Calculate Factor of Safety (Equation 8-5)

$$FS_L = \frac{CSR_L}{CSR_{EQ}}$$

$$FS_L = \underline{\hspace{2cm}}$$

Figure 8-3: Relationship Between Cyclic Stress Ratio Causing Liquefaction and SPT (N₁)₆₀ Values for Sands for M= 7.5 Earthquakes (modified From Seed et al., 1985)

Figure 8-4: Magnitude Scaling Factors Derived by Various Investigators (After Youd and Idriss, 1997)

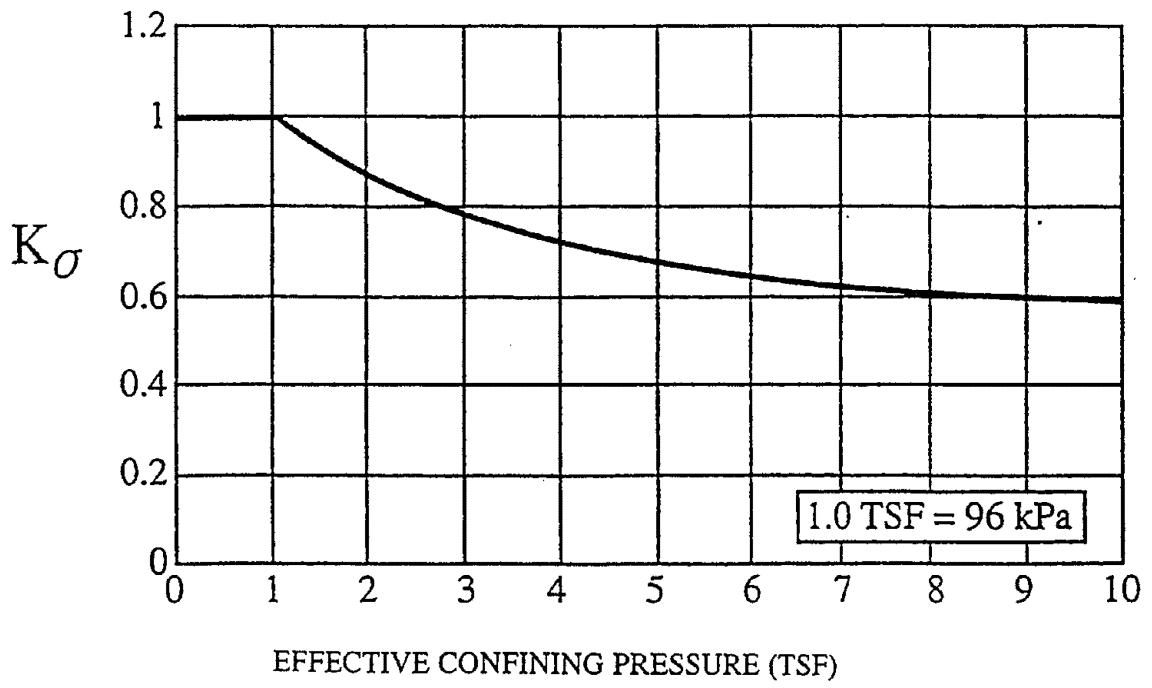

Figure 8-5: Recommended Correction Factor k_σ . (After Youd and Idriss, 1997)

SOLUTIONS TO STUDENT EXERCISE NO. 6

Step 1: Develop Subsurface Profile
(Boring with SPT-N Values Given)

Step 2: Compute Effective Overburden Pressure, σ'_v

$$\sigma'_v = 69 \text{ kPa} \quad (\text{From Student Exercise No. 2A})$$

Compute Total Overburden Pressure, σ_v

$$\sigma_v = \gamma \times 2\text{m} + \gamma_{\text{sat}} \times 4\text{m}$$

$$\sigma_v = 16 \times 2\text{m} + 19 \times 4\text{m}$$

$$\sigma_v = \underline{108 \text{ kPa}}$$

Evaluate Initial Shear Stress, τ_{ho}

$$\tau_{ho} = \underline{0} \quad (\text{Level Ground})$$

Step 3: Evaluate Stress Reduction Factor, r_d (Equation 8-1 or Figure 8-2)

$$\begin{aligned} r_d &= 1 - 0.00765 \cdot z = 1 - 0.00765 \times 6 \\ &= \underline{0.95} \quad (\text{For } z = 6 \text{ m}) \end{aligned}$$

Step 4: Calculate Cyclic Stress Ratio Induced by Earthquake, CSR_{EQ} (Equation 8-3a)

$$CSR_{EQ} = 0.65 \left(\frac{a_{\max}}{g} \right) r_d \left(\frac{\sigma_v}{\sigma'_v} \right)$$

$$CSR_{EQ} = 0.65 (0.18) 0.95 \left(\frac{108}{69} \right)$$

$$CSR_{EQ} = \underline{0.174}$$

Step 5: Standardized SPT N Value

$$C_{60} = 0.78 \quad (\text{From Student Exercise No. 2A})$$

Step 6: Normalized SPT N Value

$$C_N = 1.18 \quad (\text{From Student Exercise No. 2A})$$

$$(N_1)_{60} = C_N C_{60} N$$

$$(N_1)_{60} = 1.18 \times 0.78 \times 10$$

$$(N_1)_{60} \approx 9 \quad (\text{From Student Exercise No. 2A})$$

Step 7: Determine Soil Resistance to Liquefaction in Terms of Cyclic Stress Ratio (Use Figure 8-3)

$$CSR_{M=7.5} = \underline{0.14} \quad (\text{Based on } (N_1)_{60} = 9 \text{ and} \\ \text{Fines Content} = 15\%)$$

Step 8: Correct CSR for Earthquake Magnitude, Initial Shear Stress and Effective Overburden Pressure

$$CSR_L = CSR_{M=7.5} k_M k_\alpha k_\sigma$$

$$k_M = 1.75 \quad (\text{for } M=6.0, \text{ Figure 8-4})$$

$$k_\alpha = 1.0 \quad (\text{for Level Ground})$$

Figure 8-3: Relationship Between Cyclic Stress Ratio Causing Liquefaction and SPT (N₁)₆₀ Values for Sands for M = 7.5 Earthquakes (modified From Seed et al., 1985)

Figure 8-4: Magnitude Scaling Factors Derived by Various Investigators (After Youd and Idriss, 1997)

Figure 8-5: Recommended Correction Factor k_σ . (After Youd and Idriss, 1997)

$$k_{\alpha} = 1.0 \text{ (No Correction for } \sigma'_m < 100 \text{ kPa)}$$

(Figure 8-5)

$$CSR_L = 0.14 \times 1.75 \times 1.0 \times 1.0$$

$$CSR_L = \underline{0.245}$$

Step 9: Calculate Factor of Safety

$$FS_L = \frac{CSR_L}{CSR_{EQ}}$$

$$FS_L = \frac{0.245}{0.174}$$

$$FS_L = \underline{1.4}$$

STUDENT EXERCISE NO. 7

Simplified Seismic Deformation Analysis.

Objective:

Use Newmark Analysis Design Charts to Estimate Permanent Seismic Deformations for Three Potential Failure Surfaces Shown in Figure S7-1 for a M 6.5 Earthquake with Free-Field, Firm Ground Peak Ground Acceleration = 0.16 g.

Source Materials:

Reference Manual Part I: Figures 6-2, 6-3, 6-4, 6-5, 7-4, 7-9, and 8-2.

1. Evaluate Peak Ground Acceleration at Top of Embankment Using Figures 6-3, and 6-4

$$(PGA)_{EMB} = \underline{\hspace{2cm}}$$

Exercise 7 - Figure S7-1

2. Evaluate PAA for Failure Surface 1, 2, and 3

A. Evaluate Z/H for Use in Figure 6-5

Failure Surface 1: $Z/H =$ _____

Failure Surface 2: $Z/H =$ _____

Failure Surface 3: Not Applicable

B. Find PAA/PGA Using Figures 6-5, and 8-2

Failure Surface 1: $\left(\frac{PAA}{PGA}\right)_1 =$ _____

Failure Surface 2: $\left(\frac{PAA}{PGA}\right)_2 =$ _____

Failure Surface 3: $\left(\frac{PAA}{PGA}\right)_3 =$ _____

C. Find PAA for Each Failure Surface

$(PAA)_1 =$ _____

$(PAA)_2 =$ _____

$(PAA)_3 =$ _____

3. Evaluate k_y/PAA for Each Failure Surface

$$\left(\frac{k_y}{PAA} \right)_1 = \underline{\hspace{2cm}}$$

$$\left(\frac{k_y}{PAA} \right)_2 = \underline{\hspace{2cm}}$$

$$\left(\frac{k_y}{PAA} \right)_3 = \underline{\hspace{2cm}}$$

4. Calculate Permanent Seismic Deformation, PSD,
Using Figure 7-4

$$PSD_1 = \underline{\hspace{2cm}}$$

$$PSD_2 = \underline{\hspace{2cm}}$$

$$PSD_3 = \underline{\hspace{2cm}}$$

5. Calculate Permanent Seismic Deformation, PSD,
Using Figure 7-9

$PSD_1 =$ _____

$PSD_2 =$ _____

$PSD_3 =$ _____

Exercise 7 - Figure S7-2

Figure 6-3: Relationship Between PHGA on Rock and on Soft Soil Sites. (Idriss, 1990)

Figure 6-4: Comparisons of Peak Base and Crest Accelerations Recorded at Earth Dams. (Harder, 1991)

Figure 6-5: Variation of Peak Average Acceleration Ratio with Depth of Sliding Mass. (Makdisi and Seed, 1978, reprinted by permission of ASCE)

Figure 8-2: Stress Reduction Factor, r_d , Versus Depth Curves Developed by Seed and Idriss (1971) with Added Mean Value Lines from Equation 8-1.

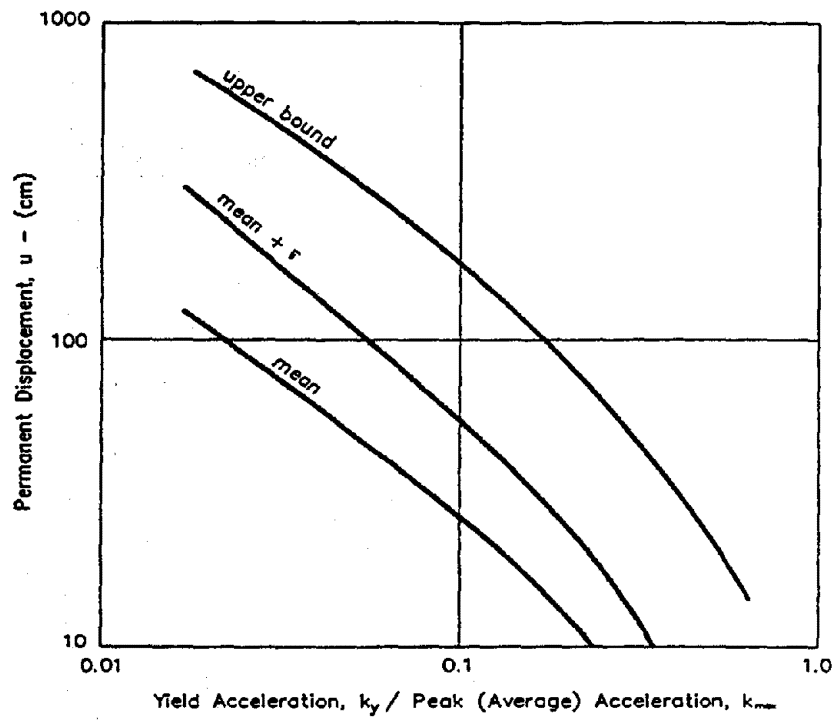

Figure 7-4: Permanent Seismic Deformation Chart. (Hynes and Franklin, 1984, reprinted by permission of U.S. Army Engineer Waterways Experiment Station)

Figure 7-9: Permanent Displacement Versus Normalized Yield Acceleration for Embankments. (After Makdisi and Seed, 1978, reprinted by permission of ASCE).

SOLUTIONS TO EXERCISE 7

1. From Figure 6-4, $PGA = 0.56$

2. A. $(Z/H)_1 = 2/10 = 0.2$
 $(Z/H)_2 = 10/10 = 1.0$

B. From Figure 6-5, $(PAA)_1 = 0.56 (0.85) = 0.48 \text{ g}$

From Figure 6-5, $(PAA)_2 = 0.56 (0.40) = 0.22 \text{ g}$

From Equation 8-1, $(PAA)_3 = 0.56 (0.64) = 0.36 \text{ g}$

3. $\left(\frac{k_y}{PAA}\right)_1 = \left(\frac{0.2}{0.48}\right) = 0.42$
 $\left(\frac{k_y}{PAA}\right)_2 = \left(\frac{0.06}{0.22}\right) = 0.27$
 $\left(\frac{k_y}{PAA}\right)_3 = \left(\frac{0.12}{0.36}\right) = 0.33$

4. $PSD_1 = < 10 \text{ cm}$

$PSD_2 = 10 \text{ cm}$

$PSD_3 = < 10 \text{ cm}$

5. $\text{PSD}_1 = 10 \text{ cm}$
 $\text{PSD}_2 = 20 \text{ cm}$
 $\text{PSD}_3 = 15 \text{ cm}$

Figure 6-5: Variation of Peak Average Acceleration Ratio with Depth of Sliding Mass. (Makdisi and Seed, 1978, reprinted by permission of ASCE)

STUDENT EXERCISE NO. 8

Stiffness Matrix for Spread Footings.

Objective:

Evaluate the Stiffness Matrix for the Center Pier of the Bridge Shown in Figure S8-1. The Pier Footing is 25 m in Length, 4.25 m Wide, and 1 m Thick. The Soil Profile at the Site is Shown in Figure S8-2. The Design Earthquake is a Moderate Magnitude ($M_w = 6.5$) Event.

Source Materials:

Reference Manual Part I: Figures 5-12, 5-13, 5-14, 9-7, 9-8 and 9-9, Tables 5-5 and 9-2, and Equations 9-11 and 9-12a through 9-12d.

1. Evaluate Equivalent Circular Radius Using Equations in Table 9-2

A. Translational Modes

$$R_z = \underline{\hspace{4cm}}$$

$$R_x = \underline{\hspace{4cm}}$$

Figure S8-1: Cross Section of Proposed Bridge and Soil Stratigraphy.

SPT Blow Counts (Blows/300mm)

Figure S8-2: Corrected SPT Results for Example No. 8 Test Borings.

B. Rotational Modes

$$R_{\psi x} = \underline{\hspace{2cm}} \text{ (X-Axis Rocking)}$$

$$R_{\psi y} = \underline{\hspace{2cm}} \text{ (Y-Axis Rocking)}$$

$$R_{\psi z} = \underline{\hspace{2cm}} \text{ Torsion}$$

2. Evaluate Maximum Shear Modulus Using Imai and Tonouchi Equation from Table 5-5

$$N_{60} = \underline{\hspace{2cm}} \text{ (From Figure S8-2)}$$

$$G_{\max} = \underline{\hspace{2cm}} \text{ (From Table 5-5)}$$

3. Reduce Maximum Shear Modulus For Strain Softening Using Figures 5-12 and/or 5-13

Moderate Magnitude Event - Assume $\gamma = 0.02\%$

$$\left(\frac{G}{G_{\max}} \right) = \underline{\hspace{2cm}}$$

$$G = \underline{\hspace{2cm}}$$

4. Calculate Stiffness Coefficients for Equivalent Circular Footing Using Equations 9-12a through 9-12d

$$v = \underline{\hspace{2cm}} \text{ (Section 5.3.3)}$$

$$k_z = \underline{\hspace{2cm}} \text{ (Equation 9-12a)}$$

$$k_x = k_y = \underline{\hspace{2cm}} \text{ (Equation 9-12b)}$$

$$k_{\psi x} = \underline{\hspace{2cm}} \text{ (Equation 9-12d)}$$

$$k_{\psi y} = \underline{\hspace{2cm}} \text{ (Equation 9-12d)}$$

$$k_{\psi z} = \underline{\hspace{2cm}} \text{ (Equation 9-12c)}$$

5. Calculate Rectangular Footing Stiffness Using Equation 9-11, Figures 9-7 and 9-8

$$\alpha_z = \underline{\hspace{2cm}} \text{ (Figure 9-7)}$$

$$\alpha_x = \underline{\hspace{2cm}} \text{ (Figure 9-7)}$$

$$\alpha_y = \underline{\hspace{2cm}} \text{ (Figure 9-7)}$$

$$\alpha_{\psi x} = \underline{\hspace{2cm}} \text{ (Figure 9-7)}$$

$$\alpha_{\psi y} = \underline{\hspace{2cm}} \text{ (Figure 9-7)}$$

$$\alpha_{\psi z} = \underline{\hspace{2cm}} \text{ (Figure 9-7)}$$

$$b_z = \underline{\hspace{2cm}} \text{ (Figure 9-8)}$$

$$b_x = \underline{\hspace{2cm}} \text{ (Figure 9-8)}$$

$$b_y = \underline{\hspace{2cm}} \text{ (Figure 9-8)}$$

$$b_{\psi x} = \underline{\hspace{2cm}} \text{ (Figure 9-8)}$$

$$b_{\psi y} = \underline{\hspace{2cm}} \text{ (Figure 9-8)}$$

$$b_{\psi z} = \underline{\hspace{2cm}} \text{ (Figure 9-8)}$$

$$k_z = \alpha_z \beta_z k_z = \underline{\hspace{2cm}}$$

$$k_x = \alpha_z \beta_z k_z = \underline{\hspace{2cm}}$$

$$k_y = \alpha_z \beta_z k_z = \underline{\hspace{2cm}}$$

$$k_{\psi x} = \alpha_{\psi z} \beta_{\psi z} k_{\psi z} = \underline{\hspace{2cm}}$$

$$k_{\psi y} = \alpha_{\psi z} \beta_{\psi z} k_{\psi z} = \underline{\hspace{2cm}}$$

$$k_{\psi z} = \alpha_{\psi z} \beta_{\psi z} k_{\psi z} = \underline{\hspace{2cm}}$$

TABLE 5-5
CORRELATIONS FOR ESTIMATING INITIAL SHEAR MODULUS

Reference	Correlation	Units	Limitation
Seed, <i>et al.</i> (1984)	$G_{\max} = 220 (K_2)_{\max} (\sigma'_m)^{1/2}$ $(K_2)_{\max} \approx 20(N_1)_{60}^{1/3}$	kPa	$(K_2)_{\max} \approx 30$ for very loose sands and 75 for very dense sands; $\approx 80-180$ for dense well graded gravels; Limited to cohesionless soils
Imai and Tonouchi (1982)	$G_{\max} = 15,560 N_{60}^{0.68}$	kPa	Limited to cohesionless soils
Hardin (1978)	$G_{\max} = \frac{625}{(0.3 + 0.7 e_o^2)} (P_a \cdot \sigma'_m)^{0.5} OCR^k$	kPa ^{(1) (3)}	Limited to cohesive soils $P_a =$ atmospheric pressure
Jamiolkowski, <i>et al.</i> (1991)	$G_{\max} = \frac{625}{e_o^{1.3}} (P_a \cdot \sigma'_m)^{0.5} OCR^k$	kPa ^{(1) (3)}	Limited to cohesive soils $P_a =$ atmospheric pressure
Mayne and Rix (1993)	$G_{\max} = 99.5 (P_a)^{0.305} (q_c)^{0.695} / (e_o)^{1.13}$	kPa ⁽²⁾	Limited to cohesive soils $P_a =$ atmospheric pressure

Notes: ⁽¹⁾ P_a and σ'_m in kPa

⁽²⁾ P_a and q_c in kPa

⁽³⁾ The parameter k is related to the plasticity index, PI , as follows:

PI	k
0	0
20	0.18
40	0.30
60	0.41
80	0.48
> 100	0.50

TABLE 9-2
EQUIVALENT DAMPING RATIOS FOR RIGID CIRCULAR FOOTINGS
 (After Richart, *et al.*, 1970)

Mode of Vibration	Mass (or Inertia) Ratio	Damping Coefficient	Damping Ratio	Equivalent Radius
Vertical Translation	$B_z = \frac{(1-\nu)}{4} \frac{m}{\rho r_o^3}$	$c_z = \frac{3.4 r_o^2}{1-\nu} \sqrt{\rho G}$	$D_z = \frac{0.425}{\sqrt{B_z}}$	$r_o = R_z = \sqrt{BL/\pi}$
Horizontal Translation (Sliding)	$B_x = \frac{(7-8\nu)}{32(1-\nu)} \frac{m}{\rho r_o^3}$	$c_x = \frac{4.6 r_o^2}{2-\nu} \sqrt{\rho G}$	$D_x = \frac{0.288}{\sqrt{B_x}}$	$r_o = R_x = \sqrt{BL/\pi}$
X- and Y-axis Rocking	$B_\psi = \frac{3(1-\nu)}{8} \frac{I_\psi}{\rho r_o^5}$	$c_\psi = \frac{0.8 r_o^4 \sqrt{\rho G}}{(1-\nu)(1+B_\psi)}$	$D_\psi = \frac{0.15}{(1+B_\psi) \sqrt{B_\psi}}$	$r_o = R_{\psi_x} = \left[\frac{16(B)(L)^3}{3\pi} \right]^{1/4}$ $r_o = R_{\psi_y} = \left[\frac{16(B)^3(L)}{3\pi} \right]^{1/4}$
Z-axis Rotation (Torsion)	$B_\theta = \frac{I_\theta}{\rho r_o^5}$	$c_\theta = \frac{4 \sqrt{B_\theta} \cdot \rho G}{1+2B_\theta}$	$D_\theta = \frac{0.5}{1+2B_\theta}$	$r_o = R_{\psi_z} = \left[\frac{16BL(B^2+L^2)}{6\pi} \right]^{1/4}$

Notes:

- m = mass of the foundation
- c = damping coefficient (c_z , c_x , c_ψ , c_θ)
- I = moment of inertia of the foundation
- ρ = mass density of foundation soil
- r_o = equivalent radius (R_z , R_x , R_ψ)
- B = width of the foundation (along axis of rotation for rocking)
- L = length of the foundation (in the plane of rotation for rocking)
- G = shear modulus of the soil
- ν = Poisson's ratio of the soil
- D = damping ratio (D_z , D_x , D_ψ , D_θ)

Figure 9-9: Embedment Factors for Footings with $D/R > 0.5$. (Lam and Martin, 1986)

SOLUTIONS TO EXERCISE NO. 8

1. Equivalent Radius

$$R_z = R_y = R_x = \sqrt{\frac{BL}{\pi}} = 5.82 \text{ m}$$

$$R_{\psi x} = \left[\frac{16(B)(L)^3}{3\pi} \right]^{1/4} = 18.32 \text{ m}$$

$$R_{\psi y} = \left[\frac{16(B)^3 L}{3\pi} \right]^{1/4} = 7.56 \text{ m}$$

$$R_{\psi z} = \left[\frac{16BL(B^2 + L^2)}{6\pi} \right]^{1/4} = 15.52 \text{ m}$$

2. Small Strain Shear Modulus

$$(N_{60}) = 28$$

$$G_{\max} = 15,560 N_{60}^{0.68} = 150,000 \text{ kPa}$$

3. Modulus Reduction

$$\left(\frac{G}{G_{\max}} \right) = 0.6$$

$$G = 90 \text{ MPa}$$

4. Stiffness Coefficients for Equivalent Circle

MODE	Equivalent Circular Stiffness Mpa - m	α	β	Stiffness Mpa - m
Vertical	3,260	1.13	1.09	4,015
Translation (X-Direction)	2,568	1.17	1.26	3,785
Translation (Y-Direction)	2,568	1.07	1.26	3,430
Rocking (X-Axis)	2,295,478	1.18	1.1	2,980,000
Rocking (Y-Axis)	161,310	1.16	1.2	225,000
Torsion	1,814,326	1.17	1.3	2,760,000

STUDENT EXERCISE NO. 9A

Geotechnical Pile Capacity Evaluation Under Seismic Loading.

Objective:

Evaluate the Effects of Seismic Loading on the Geotechnical Capacity of a Pile Group Foundation, as Shown in Figure S9A-1.

Source Materials:

Reference Manual Part II: Step 3 in Section 3.4

$$p = \frac{Q}{n} \pm \frac{M \cdot d_i}{\sum_{i=1}^n d_i^2}$$

p = vertical load on pile;

Q = static vertical load on pile cap;

n = number of piles in group (3 for this example);

d_i = distance from center of gravity of pile group to pile i ;

M = design moment.

Figure S9A-1: Pile Group Foundation

Static Case

$$Q=1,500 \text{ kN}, \quad M=0$$

$$\text{Maximum Vertical Load on Pile} = \frac{1,500\text{kN}}{3} = 500 \text{ kN}$$

(Compression)

$$\text{F.S.}_{(\text{compression})} = \frac{1,000\text{kN}}{500\text{kN}} = \underline{\quad 2.0 \quad}$$

Pile No.	Compression (kN)	Uplift (kN)	FS
1	500	-	2.0
2	500	-	2.0
3	500	-	2.0

Seismic Load Case 1

$Q=1,500$ kN, $M=3,000$ m-kN

Pile No.	Compression (kN)	Uplift (kN)	FS
1			
2			
3			

Seismic Load Case 2

$Q=300$ kN, $M=3,000$ m-kN

Pile No.	Compression (kN)	Uplift (kN)	FS
1			
2			
3			

SOLUTIONS TO EXERCISE NO. 9A

Seismic Load Case 1

$$Q = 1,500 \text{ kN}, \quad M = 3,000 \text{ m-kN}$$

- Seismic Load on Piles 1, 2 and 3

$$P_1 = \frac{1,500}{3} + \frac{3,000 \times 2}{2^2 + 2^2} = 500 + 750 = 1,250 \text{ kN}$$

$$P_2 = \frac{1,500}{3} + 0 = 500 \text{ kN}$$

$$P_3 = \frac{1,500}{3} - \frac{3,000 \times 2}{2^2 + 2^2} = 500 - 750 = -250 \text{ kN}$$

Pile No.	Compression (kN)	Uplift (kN)	FS
1	1,250	-	$\frac{1,000}{1,250} = 0.8$
2	500	-	$\frac{1,000}{500} = 2.0$
3	-	-250	$\frac{500}{250} = 2.0$

- Pile 1: Compression Failure (FS < 1.0)

Seismic Load Case 2

Q=300 kN, M=3,000 m-kN

$$P_1 = \frac{300}{3} + \frac{3,000 \times 2}{2^2 + 2^2} = 100 + 750 = 850 \text{ kN}$$

$$P_2 = \frac{300}{3} + 0 = 100 \text{ kN}$$

$$P_3 = \frac{300}{3} - \frac{3,000 \times 2}{2^2 + 2^2} = 100 - 750 = -650 \text{ kN}$$

Pile No.	Compression (kN)	Uplift (kN)	FS
1	850	-	$\frac{1,000}{850} = 1.18$
2	100	-	$\frac{1,000}{100} = 10$
3	-	-650	$\frac{500}{650} = 0.77$

- Pile 3: Uplift Failure (FS < 1.0)

STUDENT EXERCISE NO. 9B

Derivation of Foundation Stiffness for Pile Group

Objective:

Evaluate the Foundation Stiffness for a Pile Group Shown in Figure S9B-1 Using Simplified Design Charts. The Piles Are End Bearing Piles on a Hard Stratum. The Soil Overburden at the Site Consists of 30 ft (9.15 m) of Medium Stiff Clay.

Source Materials:

Reference Manual Part I: Section 9.3.6, Table 9-5, Figures 9-20, 9-21 and 9-22.

- 14-in diameter vertical cast-in-place concrete piles.
- End bearing piles on Very Hard Stratum.
- Pile Length = 30 ft.
- Pile head 6" into pile cap.
- Pile group layout 3 x 3 as shown
- Center-to-center pile spacing
 $s = 42'' = 3d$ (Longitudinal)
 $s = 70'' = 5d$ (Transverse)

- $A = \pi \times (14)^2 \times \frac{1}{4} = 154 \text{ in}^2$
- $I = \pi \times (14)^4 \times \frac{1}{64} = 1885 \text{ in}^4$
- $L = 30 \text{ ft}$
- $E = 3,600 \text{ ksi}$

Figure S9B-1: Pile Group Foundation

Step 1: Solve for the stiffness of a single pile under lateral loading.

First, determine pile head boundary condition. Assume pile head has a hinged end condition due to small pile head embedment into the pile cap (i.e., a free-headed pile analysis).

A. Determine the coefficient of variation of subgrade modulus for clay using Figure 9-20:

$$f = \underline{\hspace{2cm}}$$

B. Consider the pile group effect. Estimate the overall stiffness reduction factor (i.e., p-multiplier) using Table 9-5:

Pile Spacing in Longitudinal Direction = $3d$

Pile Spacing in Transverse Direction = $5d$

(Note: d is the diameter of the pile.)

$(p\text{-multiplier})_{ave}$ in Longitudinal Direction = $\underline{\hspace{2cm}}$

$(p\text{-multiplier})_{ave}$ in Transverse Direction = $\underline{\hspace{2cm}}$

- C. Determine effective coefficient of subgrade modulus $f_{\text{eff}} = (p\text{-multiplier})_{\text{ave}} \cdot f$:

Longitudinal: $f_{\text{eff},L} = \underline{\hspace{4cm}}$

Transverse: $f_{\text{eff},T} = \underline{\hspace{4cm}}$

- D. Calculate the Bending Stiffness of the Pile

$EI = \underline{\hspace{4cm}}$

- E. Derive lateral stiffness for free-head condition using Figure 9-21:

$k'_{\delta,L} = \underline{\hspace{4cm}}$ (Longitudinal)

$k'_{\delta,T} = \underline{\hspace{4cm}}$ (Transverse)

Step 2: Solve for the stiffness of a single pile under axial loading.

For end bearing piles (ignore skin friction), calculate the axial stiffness.

$$k_v = \frac{AE}{L} = \underline{\hspace{2cm}}$$

Step 3: Calculate pile group stiffness by combining the stiffness contribution of each individual pile.

A. Lateral Stiffness

$$K_L = n \cdot k'_{\delta,L} = \underline{\hspace{2cm}}$$

$$K_T = n \cdot k'_{\delta,T} = \underline{\hspace{2cm}}$$

Note: n is the total number of piles.

B. Axial Stiffness

$$K_v = n \cdot k_v = \underline{\hspace{2cm}}$$

C. Torsional Stiffness

$$K_{TOR} = \sum_{i=1}^n k'_{\delta,L} \cdot y_i^2 + \sum_{i=1}^n k'_{\delta,T} \cdot x_i^2$$

= _____

D. Rocking Rotational Stiffness about Transverse Axis.

$$K_{RT} = k_V \cdot \sum_{i=1}^n x_i^2$$

= _____

E. Rocking Rotational Stiffness about Longitudinal Axis.

$$K_{RL} = k_V \cdot \sum_{i=1}^n y_i^2$$

= _____

Figure 9-20: Coefficient of Variation of Subgrade Modulus for Clay.

Recommended p -Multiplier For Group Effects

Row Spacing	Front Row	2nd Row	3rd & More Rows
3D	0.8	0.45	0.35
4D	0.9	0.65	0.55
5D	1.0	0.85	0.75

9B-9

FREE HEAD PILE STIFFNESS $K\delta'$

$$\begin{aligned}
 &= K_{\delta} - \frac{K_{\delta\theta}^2}{K_{\theta}} \\
 &= 0.41 \frac{E \cdot I}{T^3} \\
 T &= \left(\frac{E \cdot I}{f} \right)^{1/5}
 \end{aligned}$$

- 1 lb/in³ = 272 kN/m³
- 1 ksf = 48 kPa
- 1 lb/in = 0.1752 kN/m
- 1 lb-in² = 2.87x10⁻⁶ kN-m²

Figure 9-21: Lateral Stiffness of Free-Headed Piles.

SOLUTIONS TO EXERCISE NO. 9B

Step 1: Solve for the stiffness of a single pile under lateral loading.

First, determine Pile Head Boundary Condition. Assume pile head has a hinged end condition due to small pile head embedment into the pile cap (i.e., a free-headed pile analysis).

A. Determine the coefficient of variation of subgrade modulus for clay using Figure 9-20:

$$f = \underline{16 \text{ lbs/in}^3}$$

B. Consider the pile group effect. Estimate the overall stiffness reduction factor (i.e., p-multiplier) using Table 9-5:

$$\begin{aligned} (\text{p-multiplier})_{\text{ave}} \text{ in Longitudinal Direction} &= \\ &= \underline{(0.8 + 0.45 + 0.35) / 3 = 0.53} \end{aligned}$$

$$\begin{aligned} (\text{p-multiplier})_{\text{ave}} \text{ in Transverse Direction} &= \\ &= \underline{(1.0 + 0.85 + 0.75) / 3 = 0.87} \end{aligned}$$

Figure 9-20: Coefficient of Variation of Subgrade Modulus for Clay.

- C. Determine the Effective Coefficient of subgrade modulus $f_{\text{eff}} = (\text{p-multiplier})_{\text{ave}} \cdot f$:

$$\text{Longitudinal: } f_{\text{eff}, L} = \underline{0.53 \times 16 = 8.5 \text{ lb/in}^3}$$

$$\text{Transverse: } f_{\text{eff}, T} = \underline{0.87 \times 16 = 13.9 \text{ lb/in}^3}$$

- D. Calculate the Bending Stiffness of the Pile

$$EI = \underline{3,600,000 \times 1885 = 6.8 \times 10^9 \text{ lb-in}^2}$$

- E. Derive lateral stiffness for free-head condition using Figure 9-21:

$$k'_{\delta, L} = \underline{1.2 \times 10^4 \text{ lb/in}} \text{ (Longitudinal)}$$

$$k'_{\delta, T} = \underline{1.7 \times 10^4 \text{ lb/in}} \text{ (Transverse)}$$

FREE HEAD PILE STIFFNESS $K\delta'$

$$= K_g - \frac{K_{ge}^2}{K_g}$$

$$= 0.41 \frac{E \cdot l}{T^3}$$

$$T = \left(\frac{E \cdot l}{f} \right)^{1/5}$$

- 1 lb/in³ = 272 kN/m³
- 1 ksf = 48 kPa
- 1 lb/in = 0.1752 kN/m
- 1 lb-in² = 2.87 x 10⁻⁶ kN-m²

Figure 9-21: Lateral Stiffness of Free-Headed Piles.

Step 2: Solve for the stiffness of a single pile under axial loading.

For end bearing piles (ignore skin friction), calculate the axial stiffness.

$$k_v = \frac{AE}{L} = \frac{154 \times 3,600,000}{30 \times 12} = \underline{1,540,000 \text{ lb/in}}$$

Step 3: Calculate pile group stiffness by combining the stiffness contribution of each individual pile.

A. Lateral Stiffness

$$\begin{aligned} K_L &= n \cdot k'_{\delta,L} = 9 \times (1.2 \times 10^4) \\ &= 1.1 \times 10^5 \text{ lb/in (Longitudinal)} \end{aligned}$$

$$\begin{aligned} K_T &= n \cdot k'_{\delta,T} = 9 \times (1.7 \times 10^4) \\ &= 1.53 \times 10^5 \text{ lb/in (Transverse)} \end{aligned}$$

B. Axial Stiffness

$$K_V = n \cdot k_v = 9 \times 1,540,000 = 1.39 \times 10^6 \text{ lb/in}$$

C. Torsional Stiffness

$$\begin{aligned}
 K_{TOR} &= \sum_{i=1}^n k'_{\delta,L} \cdot y_i^2 + \sum_{i=1}^n k'_{\delta,T} \cdot x_i^2 \\
 &= \underline{1.2 \times 10^4 \times 6 \times (70)^2 + 1.7 \times 10^4 \times 6 \times (42)^2} \\
 &= \underline{5.3 \times 10^8 \text{ lb-in/rad}}
 \end{aligned}$$

D. Rocking Rotational Stiffness about Transverse Axis.

$$\begin{aligned}
 K_{RT} &= k_V \cdot \sum_{i=1}^n x_i^2 \\
 &= \underline{1,540,000 \times 6 \times (42)^2 = 1.6 \times 10^{10} \text{ lb-in/rad}}
 \end{aligned}$$

E. Rocking Rotational Stiffness about Longitudinal Axis.

$$K_{RL} = k_V \cdot \sum_{i=1}^n y_i^2$$

$$= \underline{1,540,000 \times 6 \times (70)^2 = 4.5 \times 10^{10} \text{ lb-in/rad}}$$

Figure 9-22: Lateral Stiffness of Fixed Head Piles.

STUDENT EXERCISE NO. 10A

Dynamic Earth Pressure Approach for Seismic Design of Retaining Walls.

Objective:

Derive the Dynamic Earth Pressure for a Cantilever Wall Retaining a Highway Embankment in Collinsville, IL. The Wall Geometry, Soil Properties behind the Wall and other Assumptions are Presented in Figure S10A-1.

Source Materials:

Reference Manual Part I: Section 9.4.2, Equations 9-13a and 9-13b, and Figure 9-28.

- Location: Collinsville, IL
- Peak Acceleration on Firm Ground (or Rock)
 $A_{cc} = 0.15g$ (per current AASHTO)
- Site is Underlain by Soft Soil
- Soil Amplification Factor = 1.5
- Assume the Wall Can Yield Sufficiently to Mobilize Active Soil Wedge, But Permanent Sliding Displacement is Not Allowed.
- Other Relevant Parameters Are Given in the Sketch Below.

Figure S10A-1: Retaining Wall Geometry and Assumptions

1. Total Wall Height, $H =$ _____

2. $\delta = \phi =$ _____

3. $k_h =$ Amplified Peak Ground Acceleration/g
 $= 1.5 \times 0.15 =$ _____

Ignore Vertical Ground Motion $k_v = 0$

4. $\psi = \text{arc tan } [k_h/(1-k_v)] =$ _____

5. Compute Active Earth Pressure Coefficient (Eq.9-13b)

$$K_{ae} = \frac{\cos^2(\phi - \psi - \theta)}{\cos\psi \cos^2\theta \cos(\delta + \theta + \psi) \left[1 + \sqrt{\frac{\sin(\phi + \delta) \sin(\phi - \psi - \beta)}{\cos(\delta + \theta + \psi) \cos(\beta - \theta)}} \right]^2}$$

$K_{ae} =$ _____

6. Total Dynamic Active Earth Force (Eq. 9-13a)

$$P_{ae} = \frac{1}{2} K_{ae} \gamma H^2 = \underline{\hspace{4cm}}$$

7. Uniformly Distributed Dynamic Earth Pressure

$$p_{ae} = P_{ae}/H = \underline{\hspace{4cm}}$$

SOLUTION TO EXERCISE NO. 10A

1. Total Wall Height, $H = 5 + 0.7 = \underline{5.7 \text{ m}}$
2. $\delta = \phi = \underline{32^\circ}$
3. $k_h = \text{Amplified Peak Ground Acceleration/g}$
 $= 1.5 \times 0.15 = \underline{0.225}$

Ignore Vertical Ground Motion $k_v = 0$

4. $\psi = \text{arc tan } [k_h/(1-k_v)] = \underline{12.7^\circ}$
5. Compute Active Earth Pressure Coefficient (Eq.9-13b)

$$K_{ae} = \frac{\cos^2(\phi - \psi - \theta)}{\cos\psi \cos^2\theta \cos(\delta + \theta + \psi) \left[1 + \sqrt{\frac{\sin(\phi + \delta) \sin(\phi - \psi - \beta)}{\cos(\delta + \theta + \psi) \cos(\beta - \theta)}} \right]^2}$$

$$K_{ae} = \frac{\cos^2(32^\circ - 12.7^\circ - 0^\circ)}{\cos 12.7^\circ \cos^2 0^\circ \cos(32^\circ + 0^\circ + 12.7^\circ) \left[1 + \sqrt{\frac{\sin(32^\circ + 32^\circ) \sin(32^\circ - 12.7^\circ - 0^\circ)}{\cos(32^\circ + 0^\circ + 12.7^\circ) \cos(0^\circ - 0^\circ)}} \right]^2}$$

$$K_{ae} = \underline{0.47}$$

6. Total Dynamic Active Earth Force (Eq. 9-13a)

$$P_{ae} = \frac{1}{2} K_{ae} \gamma H^2 = \frac{1}{2} \times 0.47 \times 19 \times 5.7^2 = \underline{145 \text{ kN/m}}$$

7. Uniformly Distributed Dynamic Earth Pressure

$$p_{ae} = P_{ae}/H = 145/5.7 = \underline{25.4 \text{ kPa}}$$

For External Stability Analysis

STUDENT EXERCISE NO. 10B

Permissible Displacement Approach for Seismic Design of Retaining Walls.

Objective:

Derive the Reduced Seismic Coefficient, K_h , Using the Permissible Displacement Approach for the Same Retaining Wall in Student Exercise NO. 10A. Wall is Allowed to Displace by 50 mm. A Peak Ground Velocity of 250 mm/sec was Obtained from a Site Response Analysis.

Source Materials:

Reference Manual Part II: Section 9.4.2, Equation 9-14.

1. $d_R = \text{Allowable Displacement} = \underline{\hspace{2cm}}$
2. Peak Ground Acceleration Coefficient, $A = \underline{\hspace{2cm}}$
3. Peak Ground Velocity, $V = \underline{\hspace{2cm}}$
4. Use Eq. 9-14:

$$d_R = 0.087 \left(\frac{V^2}{A \cdot g} \right) \cdot \left(\frac{N}{A} \right)^{-4}$$

$$\Rightarrow N = K_h = \underline{\hspace{2cm}} \text{ (Transmittable Acceleration Coefficient)}$$

SOLUTIONS TO EXERCISE NO. 10B

1. $d_R = \text{Allowable Displacement} = 50 \text{ mm}$
2. Peak Ground Acceleration Coefficient, $A = 0.225$
3. Peak Ground Velocity, $V = 250 \text{ mm/sec}$
4. Use Eq. 9-14:

$$d_R = 0.087 \left(\frac{V^2}{A \cdot g} \right) \cdot \left(\frac{N}{A} \right)^{-4}$$

$$\Rightarrow 50 = 0.087 \left(\frac{250^2}{0.225 \times 9,810} \right) \cdot \left(\frac{N}{0.225} \right)^{-4}$$

$$\Rightarrow N = K_h = 0.106 \text{ (Transmittable Acceleration Coefficient)}$$

5. Use $k_h = 0.106$ and $k_v = 0$ for External Stability Analysis of the Wall
